### **Comparison of disease frequency estimates from previous reports for specific conditions**

Different studies may describe disease frequency using different measures such as incidence, cumulative incidence, lifetime prevalence, or lifetime risk, making direct comparisons difficult. Comparison of disease distribution between studies is further complicated by variation in case definitions. For example, the term “dermatitis” may include any or all of atopic eczema, contact dermatitis, seborrheic dermatitis, or any unspecified skin rash.

Our prevalence estimate for dermatitis (25.43%) was much higher than the GBD<sup>1</sup> estimate (6.82%), and the prevalence for “psoriasis or eczema” (0.7%) from the Barnett<sup>2</sup> study. The lifetime prevalence of atopic eczema from a 1994 survey of 1,077 English children aged 3 to 11 years is often cited at 20%<sup>3</sup>, and a 2003 Swedish survey of 8,469 individuals aged 20-59y reported the prevalence of eczema in adults at 14.6%<sup>4</sup>. Our estimates of 33% in children aged 1-9+years and 25.43% overall reflects the increase in prevalence of dermatitis over the years, as well as the inclusion of contact and unspecified dermatitis in our case definition.

A 2004 US survey of 162,705 individuals above the age of 12 found that 17.6% of females and 5.6% of males had current migraine<sup>5</sup>. We estimated the period prevalence of migraine to be 10.08% in females, and 3.85% in males. Our overall period prevalence of 6.97% is higher than the Barnett<sup>2</sup> estimate of 0.6%, but lower than the GBD<sup>1</sup> estimate of 20.65%. Migraineurs with mild to moderate symptoms may elect to self-treat and not consult their GPs, resulting in an underestimate of the prevalence from EHRs compared to surveys.

A survey in Great Britain conducted by Singleton et al in 2000 on 8,580 adults aged 16 to 74 years estimated the prevalence of depression to be 11%<sup>6</sup>, while the QOF prevalence was 7.3% for 2014-2015<sup>7</sup>. These were higher than the GBD<sup>1</sup> prevalence of 4.36%, and similar to the Barnett<sup>2</sup> estimate of 8.20%. Our period prevalence of 17.44% included past as well as present cases, and was therefore higher than these point estimates. The Singleton prevalence for anxiety of 9% was higher than those for GBD<sup>1</sup> (4.43%) and Barnett<sup>2</sup> (3.2%), but was, as expected, lower than our estimate of 12.96%.

Action on Hearing Loss estimates the prevalence for hearing loss to be 17% in the UK<sup>8</sup>, based on a study by Davis (1995)<sup>9</sup>. This is lower than the GBD 2017<sup>1</sup> estimate of 19.12% but higher than our (8.86%) and the Barnett<sup>2</sup> (3.4%) estimates. Many patients with hearing loss do not present to their GPs.

Public Health England (PHE) publishes the number of tuberculosis cases per annum, but not the prevalence. The case rate for 2015 was 1.05/10000<sup>10</sup>. This was consistent with our five-year cumulative incidence of TB of 5/10,000. Therefore, our period prevalence of 0.68% appears more consistent with PHE’s figures than the GBD<sup>1</sup> estimate of 9.02%.

The Respiratory Health of the Nation project in the UK based on The Health Improvement Network (THIN) primary care EHRs estimated the lifetime prevalence of asthma from 12,600,000 patient records to be 12.6% in 2012<sup>11</sup>. This was higher than the Barnett<sup>2</sup> point estimate of 6% and the GBD<sup>1</sup> prevalence of 8.37% but lower than our period prevalence of 14.99%, which also included hospital admissions.

The 20-year cumulative incidence of inguinal hernia from American hospital records for 13,452 people from 1971-1993 was calculated at 13.9% for men and 2.1% for women<sup>12</sup>. The lifetime risk from birth of inguinal hernias for a lifespan of 85 years from hospital admission records in 1976-1986 in Oxford, UK, was estimated to be 27.2% for males and 2.6% for females<sup>13</sup>. Our period prevalence estimates (11.75% for males, 3.39% for females, 7.57% for both sexes) included all abdominal wall hernias as did the GBD<sup>1</sup> estimate (0.38%).

**Supplementary Table S9.** Comparison of disease prevalences between this study, the Global Burden of Disease (GBD 2017)<sup>1</sup> study and the Barnett (2012)<sup>2</sup> study. Our study reports age and sex-standardised period prevalences in England from 1 April 2010 to 31 March 2015, whereas the GBD and Barnett studies computed point prevalences as at 2017 for the United Kingdom and 31 March 2007 for Scotland, respectively. Disease categories are arranged according to ICD-10 categories. Within disease categories, diseases are ranked in descending order of period prevalence from our study. Case definitions for some conditions may not be directly comparable – please refer to individual studies for details.

**Supplementary Table S10R.** General causes spanning several categories and their prevalences (ranked in descending order) from the Kuan 2018, GBD 2017<sup>1</sup>, and Barnett 2012<sup>2</sup> studies which are not reported in any of the other studies.

Disease label (Kuan 2018)	Prevalence per 10,000 (Kuan 2018)	Disease label (GBD 2017)	Prevalence per 10,000 (GBD 2017)	Disease label (Barnett 2012)	Prevalence per 10,000 (Barnett 2012)
		Non-communicable diseases	9213		
		Other non-communicable diseases	6170		
		Communicable, maternal, neonatal, and nutritional diseases	3463		
		Sense organ diseases	2239		
		Diabetes and kidney diseases	1499		
		Other sense organ diseases	192		
		Maternal and neonatal disorders	159		
		Endocrine, metabolic, blood, and immune disorders	137		
		Myelodysplastic, myeloproliferative, and other hematopoietic neoplasms	4		

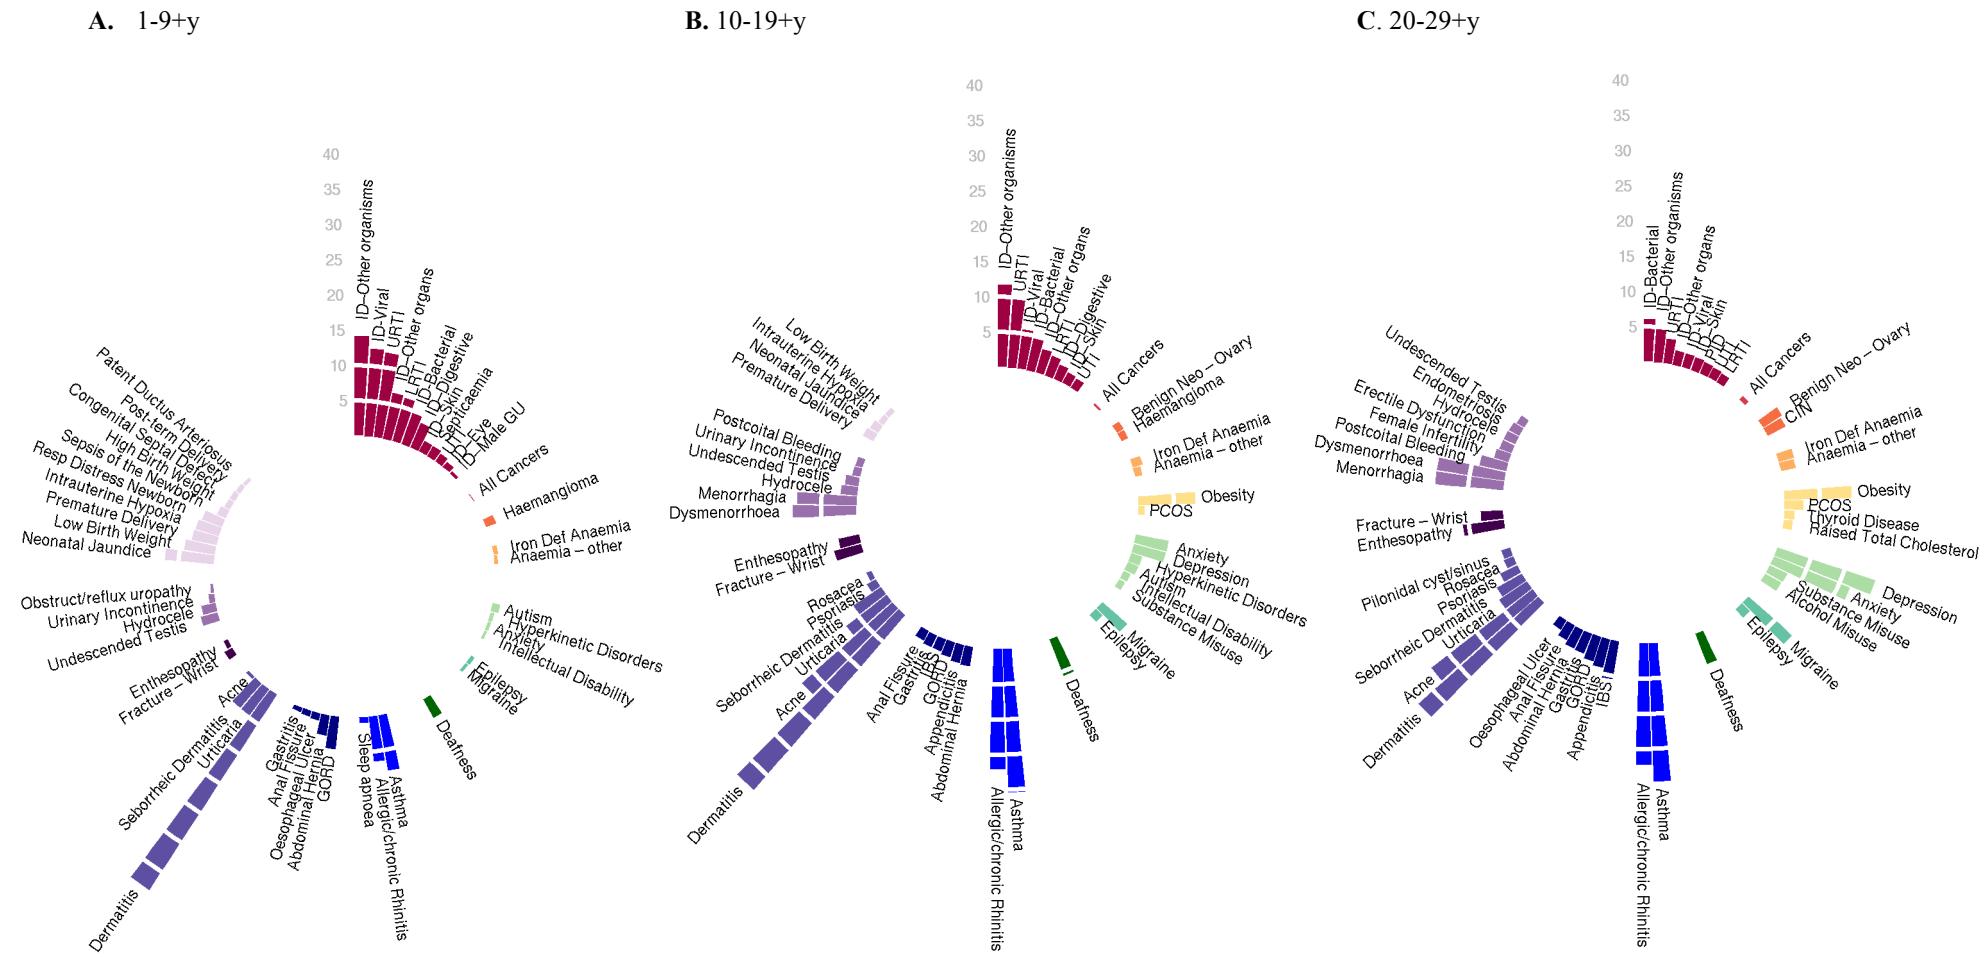

**Supplementary Figure S1.** Criteria for inclusion of health conditions in this analysis were based on FCE's, prevalence and clinical importance. FCE's were obtained from NHS Digital hospital admitted patient care activity data for England between 1 April 2014 and 31 March 2015. Abbreviations: FCE: Finished consultant episodes; ICD-10: International Classification of Diseases, tenth revision.

**Supplementary Figure S2.** Scatter plot of prevalence estimates between A) GBD<sup>1</sup> and Kuan studies where the prevalence in both studies was < 5%, B) Barnett<sup>2</sup> and Kuan studies where the prevalence in both studies was < 5%, C) GBD<sup>1</sup> and Kuan studies where the prevalence in at least one of the studies was > 5%, and D) Barnett<sup>2</sup> and Kuan studies where the prevalence in at least one of the studies was > 5%. The Kuan study used period prevalence, while the GBD<sup>1</sup> and Barnett<sup>2</sup> studies used point prevalence estimates.

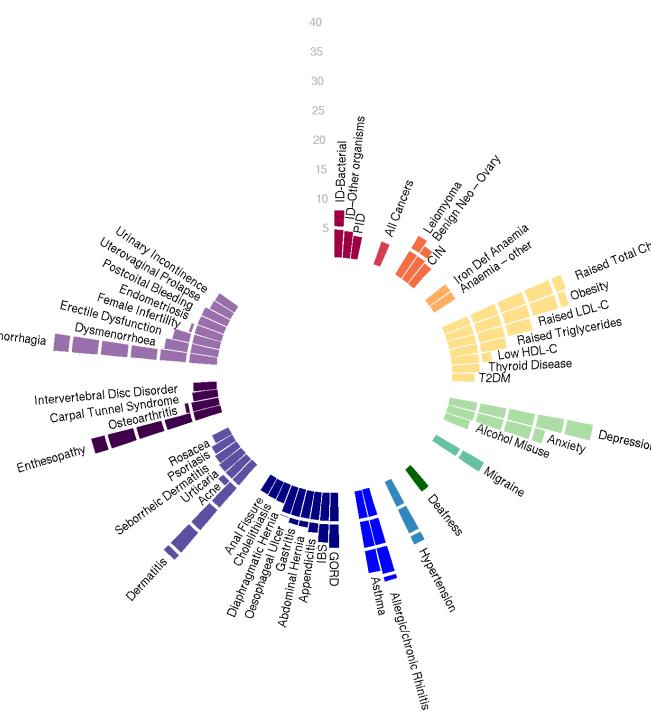

**Supplementary Figure S3.** Sex-standardised period prevalence (%) of the top 50 diseases and all cancers between 1 April 2010 and 31 March 2015 for individuals aged A) 1-9+ years, B) 10-19+ years, C) aged 20-29+ years, D) aged 30-39+ years, E) aged 40-49+ years, F) aged 50-59+ years, G) aged 60-69+ years, H) aged 70-79+ years, I) aged 80+ years on 1 April 2010

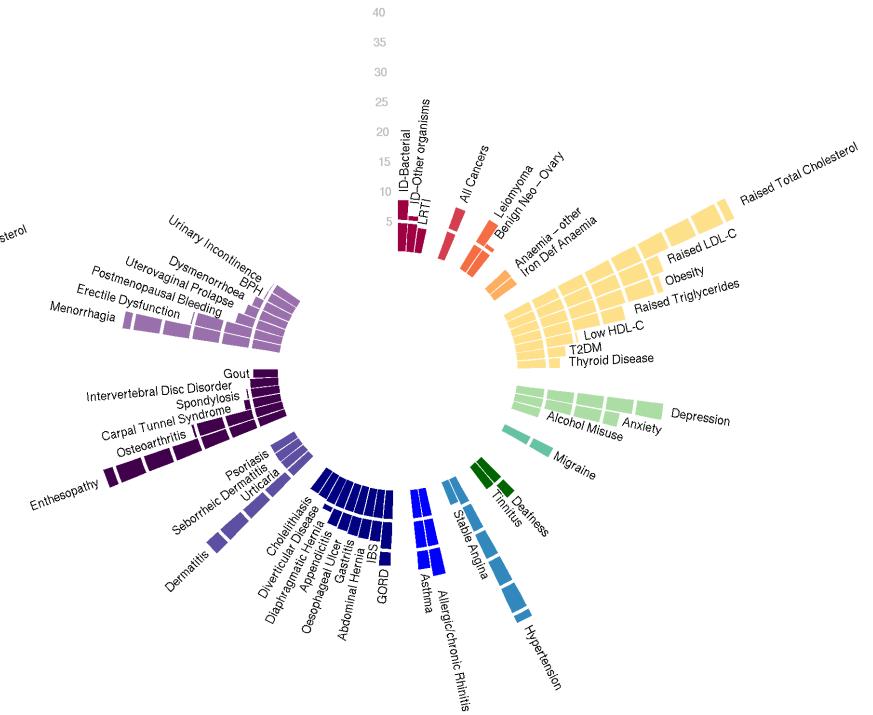

D. 30-39+y

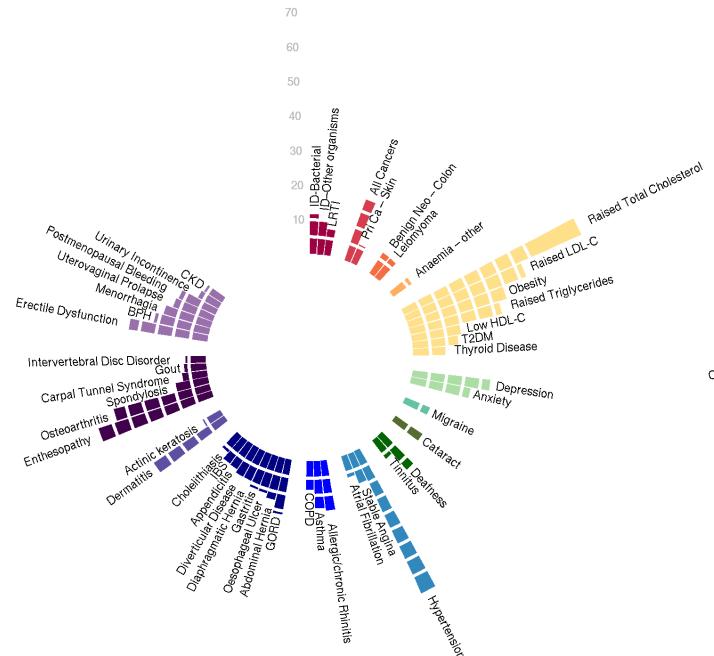

E. 40-49+y

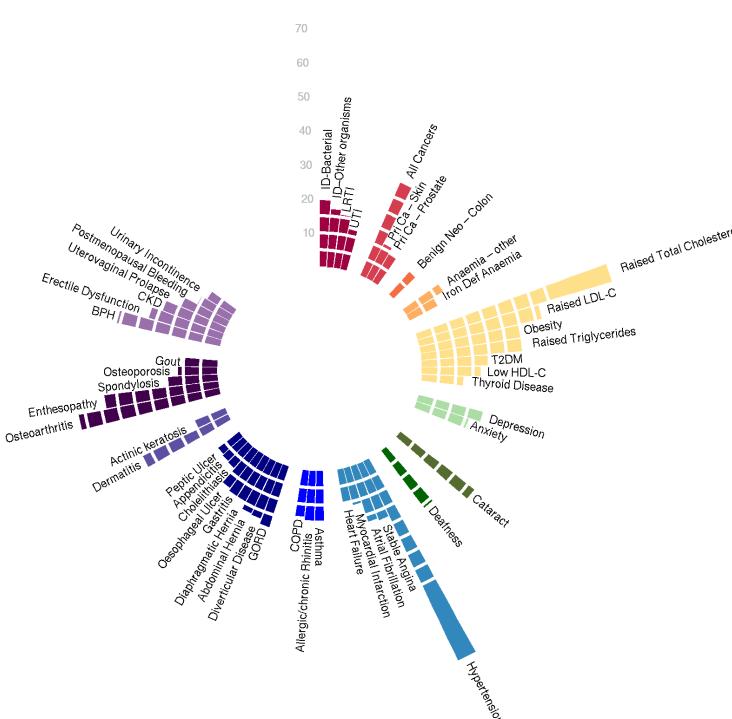

F. 50-59+y

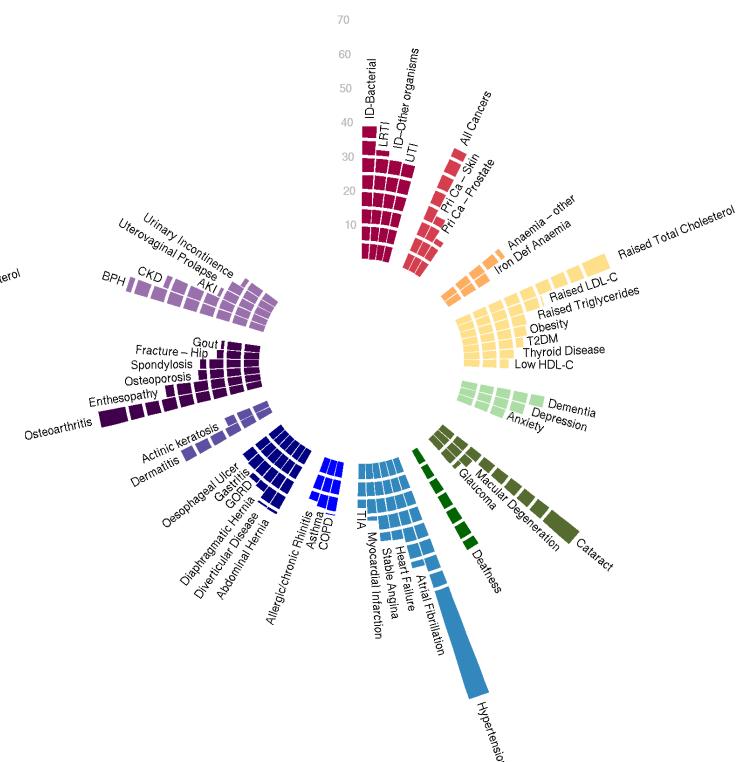

G. 60-69+y

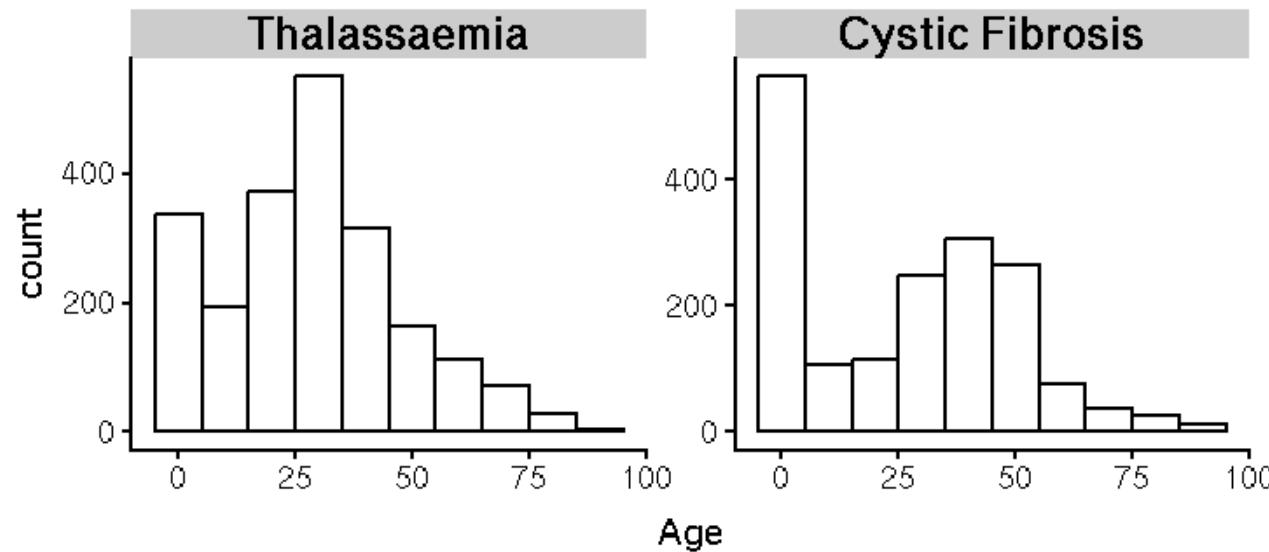

H. 70-79+y

I. 80+y

**Supplementary Figure S4.** Histogram of age at first record for thalassaemia and cystic fibrosis. The x-axis represents 10 year age bins, the y-axis represents frequency counts.
