

Supplementary Figure S2: Relative loads of bald eagle hepacivirus (BeHV) in bald eagle liver tissues. Ct values are averages across triplicate quantitative real-time reverse transcription PCR assays. Lower Ct values indicate higher relative viral loads, lines indicate means, and error bars indicate standard errors of the mean. Values are shown for six eagles from Wisconsin compared to nine eagles from elsewhere (see Table S1); the difference is not statistically significant ($t=1.376$; $df=13$; $P=0.1920$).
