

Supplemental Material

Figure S1. Number of primary isolated coronary artery bypass procedures by year and sex in patients ≤50 years of age in Sweden during 1995 to 2013.

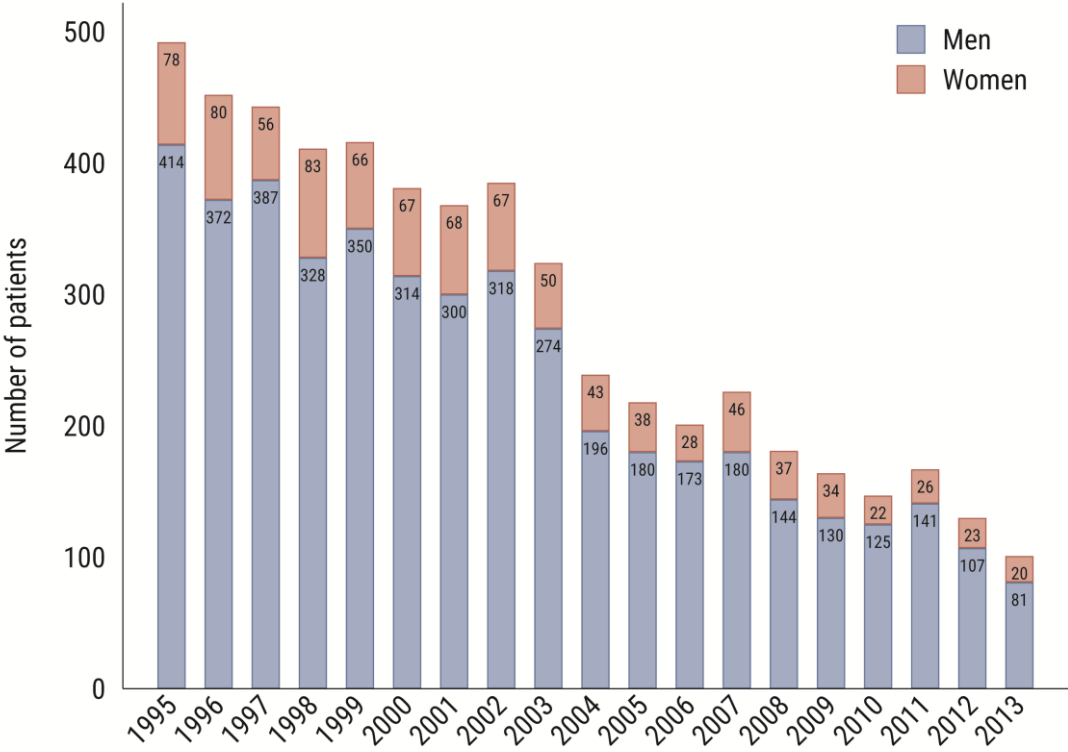

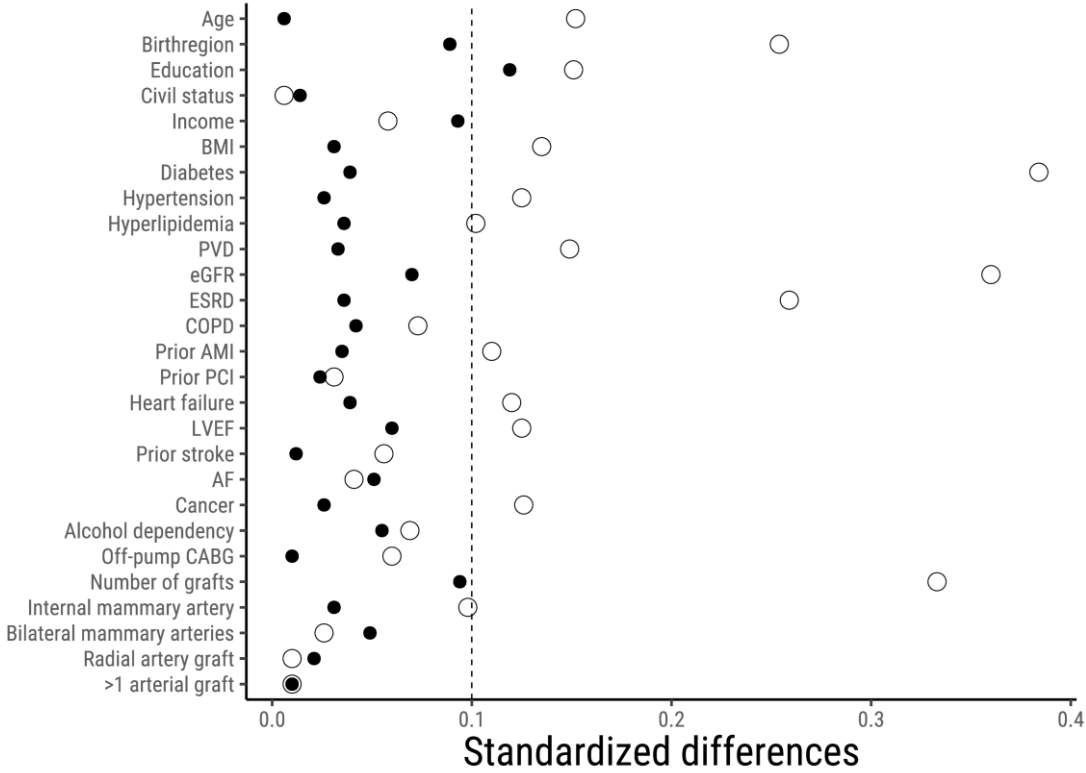

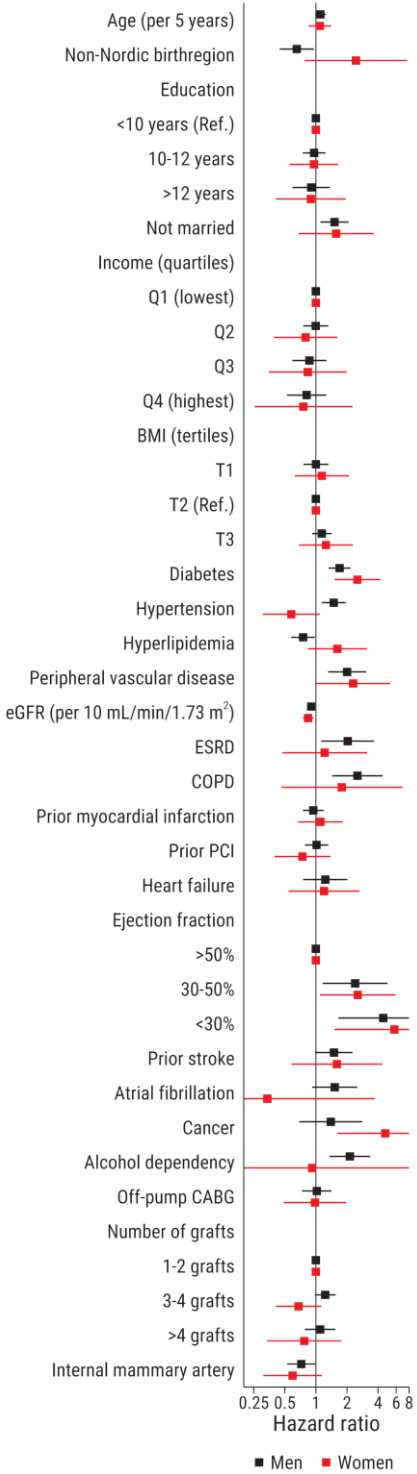

Figure S2. Absolute standardized differences before (hollow circles) and after (filled circles) inverse probability of treatment weighting.

BMI = body mass index, PVD = peripheral vascular disease, eGFR = estimated glomerular filtration rate, ESRD = end-stage renal disease, COPD = chronic obstructive pulmonary disease, AMI = acute myocardial infarction, PCI = percutaneous coronary intervention, LVEF = left ventricular ejection fraction, AF = atrial fibrillation.

Figure S3. Multivariable adjusted associations between patient characteristics and all-cause mortality. Hazard ratios are adjusted for all variables presented in Table 1.

HR = hazard ratio, eGFR = estimated glomerular filtration rate, ESRD = end-stage renal disease, COPD = chronic obstructive pulmonary disease, LVEF = left ventricular ejection fraction.
