¹ Cox proportional hazards regression models were adjusted as follows. Model 1: adjusted for age, and stratified by calendar year in 4-year intervals. Model 2: model 1 + race (Caucasian, non-Caucasian), family history of diabetes, updated history of hypercholesterolemia and high blood pressure, initial and change in smoking status (never to never, never to current, past to past, current to past, current to current, missing indicator), menopausal status and postmenopausal hormone use (premenopausal, postmenopausal + current use, postmenopausal + past use, postmenopausal + never use, missing indicator, in NHS and NHS II) and oral contraceptive use (never, current, past, missing indicator, in NHS II), initial BMI (<21.0, 21.0-24.9, 25.0-29.9, 30.0-31.9, >32.0 kg/m²), initial and change in physical activity level (MET-h/wk, quintiles), initial and changes in energy and alcohol intakes (quintiles), initial and change in AHEI score (calculated without the alcohol component, quintiles), initial intake of model-specific dairy product (quintiles or tertiles), and initial and change in other dairy product intakes (quintiles). Results of the 3 cohorts were pooled using an inverse variance-weighted, fixed-effect meta-analysis. *P* for heterogeneity was assessed using the Q statistic.

² Whole milk *P* value for sex interaction = 0.85.

³ Cream *P* value for sex interaction = 0.96.

⁴ Ice cream *P* value for sex interaction = 0.87.

⁵ Sherbet *P* value for sex interaction = 0.81.

¹ Cox proportional hazards regression models were stratified by calendar year in 4-year intervals and adjusted for age, race (Caucasian, non-Caucasian), family history of diabetes, updated history of hypercholesterolemia and high blood pressure, initial and change in smoking status (never to never, never to current, past to past, current to past, current to current, missing indicator), menopausal status and postmenopausal hormone use (premenopausal, postmenopausal + current use, postmenopausal + past use, postmenopausal + never use, missing indicator, in NHS and NHS II) and oral contraceptive use (never, current, past, missing indicator, in NHS II), initial BMI (<21.0, 21.0-24.9, 25.0-29.9, 30.0-31.9, >32.0 kg/m²), initial and change in physical activity level (MET-h/wk, quintiles), initial and changes in energy and alcohol intakes (quintiles), initial and change in AHEI score (calculated without the alcohol component, quintiles), and initial intake of model-specific dairy product (quintiles or tertiles), and initial and change in other dairy product intakes (quintiles), and change in body weight (quintiles). [†] Results of the 3 cohorts were pooled using an inverse variance-weighted, fixed-effect meta-analysis. *P* for heterogeneity was assessed using the Q statistic.
