

Supplemental Table 1. Initially selected cell markers for identifying cell types in skeletal muscle

Cell Type	Markers	References
MSC	CD73, CD90, CD105, CD271	(31, 75)
Pericytes	CD146, NG2, alkaline phosphatase, α SMA and CD90	(16,17,29, 34)
Myogenic cells	CD56	(76)
Interstitial cells		
Fibroblasts	TCF7L2, CD34	(8,15)
Telocytes	CD34	(8)
Fibroadipogenic progenitor cells	PDGFR α , CD15	(6,7)

Supplemental Table 2. Materials Used in the Study

Healthy muscle	Age /years	Atrophy	Age /years
Normal	0.2	Plantar muscle, angioma	28
Normal	2	Type 2 atrophy	74
Normal	2	Supraspinatus, type 2 atrophy	61
Normal	5	Type 2 atrophy	62
Normal	11	Inflammation	
Normal	15	Absces	10
Normal	15	Dermatomyositis, S3: NG2/ α SMA	25
Temporalis, RC	24	Dermatomyositis	33
Normal	26	Polymyositis, anti-synthetase syndrome	43
Normal	30	Extra ocular, myositis (IgG4)	45
Tongue	30	IBM	53
Normal	31	Intercostal muscle, necrosis	54
RC	31	IMN, Fig. 4A, S2: CD45; TCF7L2 C, D, E and G; AP E and F and S3: nestin	55
RC	33	IBM	61
Fig. 2 and S3: CD90 and CD146	45	IBM	62
RC	50	Dermatomyositis sarcoidosis	62
Pectoralis, RC	50	IBM	63
RC	51	IMN, Fig. 1B	67
Normal	54	IMN, statin induced	68
Fig. S2: TCF7L2 A and B	58	IBM	68
Normal	73	IBM	70
RC	74	IBM, Fig.1A	71
		IBM	71
		Slight inflammation	73
Denervation			
Denervation	7	IBM, Fig. 4B, Fig. 5 and Fig. 7C	76
Neurogenic atrophy, Fig. 7B, S3: α SMA	17	IBM fatty degeneration	79
Kennedys disease, Fig. 7A	49	IBM fatty degeneration	70
Denervation	51		
Gastrocnemius	57	Ischemia	
Denervation	57	Gracilis, compartment syndrome, Fig. 6	37
Denervation	67	Triceps surae	60
Denervation	68	Triceps surae	73
Denervation	75	Triceps surae	75
		Triceps surae	85
Myopathy			
Degenerative changes/myopathy	2	Triceps surae	90
Congenital myopathy	2	Ectopic	
Degenerative changes	29	Skin, rhabdomyomatous harmatoma, S1	11
Vacuolar myopathy	40		
Degenerative changes, S4	41		
Degenerative changes, mitochondrial myopathy	74		
Degenerative changes/myopathy	79		

The biopsies were taken from m. quadriceps unless another muscle is stated. INM: Immune-mediated necrotizing myopathy, IBM: inclusion body myositis, RC: reactive changes, AP:alkaline phosphatase

S1. Expression of endomysial CD10 in different skeletal muscles. A: In this example of ectopic skeletal muscle, CD10 is expressed between muscle fibers in a cutaneous hamartoma consistent with hamartomas being composed of all normal components of a tissue. However, in the interface between muscle fibers (f) and connective tissue the CD10 expression is scarce or absent.

Rhabdomyomatous mesenchymal hamartoma of the skin. B-F: CD10 expression in various skeletal muscles. B: external eye muscle (IgG4 disease), C: m. pectoralis major, D: m. temporalis, E: pharynx muscle and F: tongue.

A: scale bar = 100 μm , B-F: scale bar = 100 μm

S2. CD45, TCF7L2 and alkaline phosphatase

CD45: CD10+ cells do not express CD45 shown by SIMPLE. Scale bar = 100 μm

TCF7L2: A and B: the anti-TCF7L2 diluted 1:200 and 1:1000 respectively (healthy muscle) and C, D, and E the anti-TCF7L2 diluted 1:200, 1:400 and 1:1000 respectively. A reduction in antibody concentration results in a reduced number of TCF7L2 positive nuclei. C, D, E and G show interstitial cells in an immune mediated necrotizing myopathy. F and G show double staining for CD10 (red) and TCF7L2 (brown). F: An interstitial CD10+/ TCF7L2+ cell (arrow) in normal muscle. In capillaries (c) TCF7L2 is strongly expressed in endothelial cells but also stains adventitial cells. G: In damaged muscle both CD10+ cells with TCF7L2 (black arrows) and without TCF7L2 (white arrows) are seen. Scale bar for A-E and G = 100 μm , F=50 μm .

Alkaline phosphatase: Alkaline phosphatase expression shown by enzyme histochemistry (A and D), single immunohistochemistry (B and E) and in combination with αSMA or CD10 (C and F). A and B: alkaline phosphatase is seen in endothelial cells. C: αSMA (red) combined with alkaline phosphatase (brown) demonstrates the $\alpha\text{SMA}+$ pericyte surrounding the alkaline phosphatase+ endothelial cells. D: Enzyme histochemistry for alkaline phosphatase in damaged muscle shows staining in the periphery of damaged fibers. E: Alkaline phosphatase is widely distributed in interstitial cells in damaged muscle. F: CD10+ cells (red) are seen together with alkaline phosphatase (brown, black arrows) or without alkaline phosphatase (white arrows). A-C: biopsies from normal muscle, D: from a toxic myopathy and E and F: from an immune mediated necrotizing myopathy. Scale bar for A, B, C, D and F= 50 μm and E=250 μm .

CD45

TCF7L2

Alkaline phosphatase

S3. Marker expression in pericytes.

α SMA, CD146 and CD90 are expressed in pericytes (arrows) while CD10 is present at the abluminal side of the endomysial pericytes. Nestin can be found in some pericytes (arrows).

α SMA⁺ cells also express NG2 (arrow heads) indicating that α SMA in the endomysium stains pericytes. CD10 combined with α SMA, CD146 and CD90 were shown by SIMPLE. The

NG2/ α SMA staining was performed with immunofluorescence on cryosections.

Scale bars for α SMA, CD90 and nestin = 50 μ m and scale bar for CD146 = 100 μ m

S4. Blood vessels

In blood vessels, CD10 is seen in adventitia particularly adjacent to the media. CD90 is found in the inner adventitia where it co-localizes with CD10. CD73 is present in the adventitia and partly co-localizes with CD10. In addition endothelial cells are stained. CD34 is expressed in the adventitia and endothelial cells. In adventitia CD34 co-localizes with CD10 particularly in the inner layer close to media. PDGFR α co-localizes with CD10 in the outer layer of adventitia. CD271 co-localizes with CD10 in the adventitia. SIMPLE technique was used.

Scale bar = 100 μ m

CD34

PDGFR α

CD271

S5. Nerve

In intra muscular nerves CD10 in myelinating Schwann cells co-localize with CD271 and PDGFR α and with CD271 in perineurium. No co-localization is found with CD34

Scale bar= 50 μ m.
