This supplementary material has been provided by the authors to give readers additional information about their work.

eMethods. Additional Information

Granule release assay

The granule release assay was performed according to Wheeler et al. (2010). Peripheral blood mononuclear cells (PBMC) were stimulated with IL-2 overnight, and then incubated with FITC-conjugated anti-CD107a antibody alone, or with anti-CD3 antibody or PHA, for 2 h. Samples were analyzed by flow cytometry and gating on lymphocytes by forward/side scatter. CD107a expression was analyzed on cytotoxic T cells (CD8+ and CD3+) and on NK cells (CD56+ and CD3-), and the increase in percentage of CD107a+ cells between unstimulated and stimulated samples was calculated.

XIAP and SAP Protein expression.

Normal healthy control and whole blood was fixed and permeabilized using Intraprep/Intraperm (Beckman Coulter) according to manufacturer's protocol. An isotype IgG (BD Biosciences), anti-SAP (Abnova) or anti-XIAP (BD Biosciences) was added at to each tube, incubated 15 minutes room temperature, washed with PBS/0.1mM EDTA/1%BSA followed by staining with anti-CD3, anti-CD56 and anti-CD8 (BD Bioscience) for 10 minutes at room temperature. Samples were then washed, fixed (Cell Fix, BD Bioscience) and acquired on a FACsCalibur (BD Bioscience). Using Celle Quest software (BD Bioscience), sequential gating was used to identify the CD8 population and then histogram analyses with SAP and XIAP overlaying the isotype. Controls have >50% positivity for SAP and XIAP.

Bioinformatics parameters used for both SureCall and Genesis pipelines.

Agilent SureCall (Version 4.0.1.46) analysis parameters:

SNPPET caller in SureCall was used to identify single nucleotide polymorphisms (SNPs), multiple nucleotide polymorphisms (MNPs). The parameters that SureCall uses to identify SNPs, MNPs, and indels are:

- QC Metric applied: true
- Report Regions Having Read Depth Below: 20
- Enable Trimming: true
- Quality Threshold for Trimming: 5
- Minimum Read Length Fraction: 30
- Maximum Read Length Fraction: 100
- Aligner applied: true
- Illumina: BWA MEM
- Mismatch Penalty: 4.0
- Base Quality Encoding: Auto Detect
- Score Threshold for a Match: 1.0
- Maximum Number of Mismatches: 2
- Output Filter: Unique Best Hits
- Constraint for maximal gap length: 100
- Minimum matching seed length: 19
- Remove Duplicates: true
- Region Padding applied: true
- Region Padding: 100
- BAQ SNP Caller applied: false
- SNPPET SNP Caller applied: true
- Quality value threshold: 0.3
- Use base quality recalibration: false

- Minimum mapping quality for read: 30
 - Minimum quality for base: 30
 - Report multiple Alleles at a locus: false
 - Quality value threshold (low frequency): 100
 - Minimum Allele Frequency: 0.03
 - Minimum number of reads supporting variant allele: 10
- Parameters for SureCall data analysis for Copy Number Variation.*
- QC Metric applied: true
 - Report Regions Having Read Depth Below: 20
 - Enable Trimming: true
 - Quality Threshold for Trimming: 5
 - Minimum Read Length Fraction: 30
 - Maximum Read Length Fraction: 100
 - Aligner applied: true
 - Illumina: BWA MEM
 - Mismatch Penalty: 4.0
 - Base Quality Encoding: Auto Detect
 - Score Threshold for a Match: 1.0
 - Maximum Number of Mismatches: 2
 - Output Filter: Unique Best Hits
 - Constraint for maximal gap length: 100
 - Minimum matching seed length: 19
 - Remove Duplicates: true
 - Region Padding applied: true
 - Region Padding: 100
 - BAQ SNP Caller applied: false

 - Quality value threshold: 0.3
 - Use base quality recalibration: false
 - Minimum mapping quality for read: 30
 - Minimum quality for base: 30
 - Report multiple Alleles at a locus: false
 - Quality value threshold (low frequency): 100
 - Minimum Allele Frequency: 0.01
 - Minimum number of reads supporting variant allele: 10
 - Minimum number of read pairs per barcode: 2
 - Minimum number of reads supporting Denovo variant: 10
 - Denovo variant quality: 0
 - Denovo variant genotype quality: 10
 - SNP Filter: true
 - Absolute difference in max base quality observed for variant and wild type reads: 20:20:20
 - Mutation Impact: Default
 - Version of Annotation: V3

Parameters for Genesis data analysis

Genesis is an in-house pipeline, developed at NE Thames Regional Genetics laboratory. In short, paired end reads were aligned to the human genome (GRCh37) using Burrows-Wheeler Aligner (BWA)-MEM version 0.7.15⁴⁷ and the variant calling was performed using Freebayes (sensitive settings; version 1.1.0; <https://github.com/ekg/freebayes>) using region of interest of the targeted genes. VEP87 and Gemini v0.20 were used for variant annotation and filtering. Variants were further annotated using Alamut-batch (version 1.9; <http://www.interactive-biosoftware.com/alamut-batch/>) and variants with ExAC frequency > 2% were filtered out. CNVs were called using a bioconductor package ExomeDepth (version 1.0.7;⁴⁸) excluding sex chromosomes. Coverage depth was calculated using chanjo (version 2.3.2; <https://github.com/robinandeer/chanjo>).

eTable 1. List of laboratory investigations organized in context of routine clinical care for patients with suspected neuroinflammation. CSF=cerebrospinal fluid. ANA=antinuclear antibodies. ENA=extranuclear antibodies. ANCA=antineutrophil cytoplasmic antibodies. MOG=myelin oligodendrocyte antibodies.

Full blood count and blood film
Erythrocyte sedimentation rate
C-reactive protein
Urea creatinine and electrolytes
Liver function tests
CSF glucose and protein, microscopy and culture.
CSF/serum oligoclonal bands
CSF neopterins
Clotting screen
C3 and C4 levels, complement function
IgG/IgM/IgG
ANA/dsDNA/ENA
ANCA
MOG antibodies
Anti-aquaporin4 antibodies
Urine for albumin: creatinine ratio.
Thyroid function and thyroid antibodies
Plasma amino acids, lactate, ammonia
For patients with suspected vasculopathy plasma homocysteine and alpha galactosidase levels
Muscle biopsy for respiratory chain enzymes in case of suspected mitochondrial disease

eTable 2. Detailed list of genes included in Neuroinflammation panel (NIP).

Gene	HGNC Symbol	Gene Name	Disease Group	Chr	Transcript reference from HGNC
<i>ACTA2</i>	<i>ACTA2</i>	Actin alpha 2	Arteriopathies	10	NM_001613
<i>BMPR2</i>	<i>BMPR2</i>	Bone morphogenetic protein receptor type 2	Arteriopathies	2	NM_001204
<i>CBL</i>	<i>CBL</i>	Cbl proto-oncogene	Arteriopathies	11	NM_005188
<i>CBS</i>	<i>CBS</i>	Cystathione-beta-synthase	Arteriopathies	21	NM_000071

eTable 6. Clinical features and class 4 and 5 genetic variants identified on Neuroinflammation gene panel (NIP) in patients with suspected genetic neuroinflammatory disorders and unknown molecular diagnoses. MRI=magnetic resonance imaging; GAD=glutamic acid decarboxylase; OGB=oligoclonal bands; JAK=janus kinase; HSCT=haematopoietic stem cell transplantation; HLH=haemophagocytic lymphohistiocytosis; ANA=antinuclear; IVIG=intravenous immunoglobulin; CT=computed tomography; CSF=cerebrospinal fluid; AD=autosomal dominant; AR=autosomal recessive. T=tolerated; B=benign; D=damaging; N=polymorphism; Het= heterozygous; Hom= Homozygous; Hemi= hemizygosity; XLR= X-linked recessive; XL= X-linked.

Patient number	Sex	Age (Years)	Gene	Nucleotide Change	Amino Acid Change	Predicted pathogenicity	Mode of inheritance/ Zygosity	Variant Classification	Clinical Features, laboratory investigations and treatment	Clinical impact of NIP and suspected diagnosis after genetic testing
17	F	18	<i>NLRP3</i>	c.2557A>G	p.Thr85 3Ala	T/B/D	AD/Het	3	Clinical features: Recurrent episodes of encephalopathy, seizures, psychiatric symptoms, left homonymous quantranopia, diabetes, autoimmune thyroiditis. No other systemic symptoms or other organ involvement. Investigations: MRI brain showed abnormal signal and atrophic changes in right occipital lobe with extension in right thalamus and mesiotemporal lobe. Atrophic changes subsequently extended to right cerebellar hemisphere and right parietal lobe. Positive GAD antibodies, negative other autoantibodies. No acute phase response. Treatment: IVIG	Unclassified neuroinflammatory disease
			<i>NLRC4</i>	c.2785G>T	p.Ala92 9Ser	T/B/.	AD/Het	3

eFigure. Further Tests in Patients With Isolated Neuroinflammation

eFigure. (A) Absent signaling-lymphocytic-activation-molecule-associated protein (SAP) protein expression in lymphocytes derived from a 3 year old patient with isolated neuroinflammation due to X linked lymphoproliferative disease. (B) Pedigree for family of same patient (IV-1) diagnosed with X linked lymphoproliferative disease due to heterozygous NM_002351:c.C163T (p.Arg55Ter) in the SH2 Domain Containing 1A (*SH2D1A*) gene. His sibling (IV-2) also carried the same mutation. (C) Hair shaft examination from patient 42, showing prominent, diffuse clumps of melanin pigment, typical of Griscelli syndrome. She was identified on NIP to have two variants NM_004580:c.C550T (p.Arg184Ter) and NM_004580:c.G259C (p.Ala87Pro) variants in the Member RAS Oncogene Family (*RAB27A*) gene.
