^a days post infection

^b frequency within CD4⁺CD8α⁺ cell population, pre gated from viable CD3⁺ lymphocytes (see Fig. 5A)

^c For the detailed clinical scoring system see Table S1.

^d not determined

^e Clinical signs of this piglet were most likely not associated with the experimental infection.

† piglets were euthanized before 14 dpi.

^f This piglet was euthanized due to persisting clinical signs including high fever ($\geq 40.5^{\circ}\text{C}$), apathy and anorexia over 32 hours.
