

THE LANCET Infectious Diseases

Supplementary webappendix

This webappendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Nic Lochlainn LM, de Gier B, van der Maas N, et al. Immunogenicity, effectiveness, and safety of measles vaccination in infants younger than 9 months: a systematic review and meta-analysis. *Lancet Infect Dis* 2019; published online Sept 20. [https://doi.org/10.1016/S1473-3099\(19\)30395-0](https://doi.org/10.1016/S1473-3099(19)30395-0).

Supplementary webappendix for:

Immunogenicity, effectiveness, and safety of measles vaccination in infants younger than 9 months: a systematic review and meta-analysis

Table of Contents

Database search strategy	2
Decision rules for data selection and extraction processes	8
Eligibility criteria	8
Exclusion criteria	8
Definitions of seroconversion accepted for inclusion in the review	9
Definitions of seroconversion not accepted for inclusion in the review	10
Characteristics of studies included in the review by outcome	11
Proportion seroconverted by age of MCV1 (4-8 months) and measles vaccine strain.....	15
Forest plots for seroconversion	17
Proportion seroconverted, pooled estimates per single ages and age ranges.....	22
Univariable meta-regression results for seroconversion	24
Multivariable meta-regression results for seroconversion	25
Proportion seroconverted head-to-head comparison of 6-month-old infants vaccinated with Schwarz or Edmonston-Zagreb	26
Forest plot with geometric mean titre (GMT) results from plaque reduction neutralization testing (PRNT) with accompanying confidence intervals or standard errors following MCV1 <9 months of age	27
Forest plots for safety	28
GRADE summary of evidence table.....	33
Multivariable meta-regression results for seroconversion in the absence or presence of maternal antibodies	35

Decision rules for data selection and extraction processes

Table 2: Decision rules for data selection and extraction processes

Eligibility criteria

Types of studies

- Randomized control trials (RCTs), quasi-randomised control trials (qRCTs), outbreak investigations, cohort and case control studies regarding vaccination schedules for currently licensed measles containing vaccines (MCV).

Types of participants

- Infants <9 months of age receiving their first dose of a MCV.

Types of intervention

- Any currently licensed MCV administered to infants <9 months of age. A currently licensed MCV can be:
 - Monovalent vaccine: Schwarz, Moraten, Edmonston, Edmonston-Zagreb, Leningrad-16, Shanghai-191, CAM-70, AIK-C and TD97.
 - Combination vaccine containing various combinations of the above measles strains with other viruses: measles and rubella (MR), measles, mumps and rubella (MMR), measles, mumps, rubella and varicella (MMRV).

Minimum data requirements

- For inclusion in the review, all articles must report age at vaccination. Likewise, for studies on safety, an adverse event following immunization case definition is required, while immunogenicity studies should report the exact vaccine strain and/or potency used and type of laboratory test used.

Exclusion criteria

- Ecological studies, case reports, non-human primate studies, meeting abstracts, editorials, newspaper articles and other forms of popular media were excluded.
- High titre vaccines were excluded from the review, defined as vaccines with a TCID₅₀ of ≥ 4.7 or p.f.u. of $\geq 50,000$ (F. Cutts, personal communication). Titres below this cut-off were assumed to be 'standard'. Study results derived from combining MCV with gamma globulin or obtained after intradermal (rather than subcutaneous) administration of MCV were also excluded from the review.
- Failure to meet any one of the above eligibility criteria.

Definitions of seroconversion accepted for inclusion in the review

Table 3: Definitions of seroconversion accepted for inclusion in the review

Author, year	Definitions accepted for seroconversion	Type of sample	Type of test
Abanamy et al., 1992	Greater or equal than fourfold rise in titre	Serum	Other
Anonymous, 1977	Greater or equal than fourfold rise	Blood cells	Other
Anonymous, 1981	From seronegative to seropositive	Fingerstick	HIA
Anonymous, 1982	Greater or equal than fourfold increase in titre or greater or equal 1:10	Serum	HIA
Bolotovski et al., 1994	From negative to positive or a greater or equal than fourfold titre rise above expected decay	Fingerstick	HIA
Carson et al., 1995	PRNT: fourfold increase in measles antibody titre	Serum	PRNT
Cutts et al., 1994	Fourfold rise in titre pre/(expected) post vaccination 6 weeks and 6 months post vaccination	Fingerstick	PRNT
Diaz-Ortega et al., 1986	Fourfold increase or change from seronegative to seropositive	Fingerstick	HIA
Ekunwe, 1985	Fourfold rise in antibody titre	Fingerstick	HIA
Fernandez de Castro et al., 1986	Greater or equal than fourfold increase pre/post vaccination	Serum	HIA
Gans et al., 2013	Greater or equal than fourfold increase in GMT (1998 paper)	Serum	PRNT
He et al., 2014	Any positive antibody response in seronegative infants or ≥ 4 titer increase	Serum	ELISA
Job et al., 1984	Seronegative to seropositive	Fingerstick	HIA
Johnson et al., 1994	Seronegative to seropositive	Serum	Other
Katiyar et al., 1985	Greater than fourfold rise in HAI titre	Serum	HIA
Khanum et al., 1987	Fourfold increase in HI	Heel prick	HIA
Mandara et al., 1985	Fourfold rise in titre post-vaccination	Serum	HIA
Markowitz et al., 1990	Change from negative (<40miu) pre-vaccination to positive post-vaccination or fourfold increase in level above calculated titre expected 8 or 18 weeks post-vaccination	Fingerstick	PRNT
Ndumbe et al., 1995	Prevaccination <200 mu/ml and postvaccination positive or greater or equal fourfold increase 6 weeks postvaccination	Serum	ELISA
Nkrumah et al., 1998	Seronegative to seropositive, or greater or equal fourfold increase in titre given decay	Serum	HIA
Pabst et al., 1999	Fourfold increase in titer, adjusted for decay of maternal antibodies	Serum	PRNT
Pongritsukda et al., 1991	No detectable to detectable antibody	Serum	PRNT
Rogers et al., 1991	Fourfold increase	Blood cells	ELISA
Schatzmayr et al., 1982	Proportion seroconverted in those negative before vaccination (HI<10)	Serum	HIA
Semba et al., 1995	Greater or equal than fourfold titre rise	Serum	PRNT
Soula et al., 1991	Lower antibody titer of 1/10 before vaccination and equal or higher post vaccination	Serum	HIA
Stewien et al., 1978	Greater or equal than fourfold titre increase between pre and post vaccination sample	Serum	HIA

Definitions of seroconversion not accepted for inclusion in the review

Table 4: Definitions of seroconversion not accepted for inclusion in the review

Author, year	Definitions not accepted for seroconversion	Type of sample	Type of test
Breman et al., 1975	No definition given	Serum	HIA
Cutts et al., 1994	Optical density ratio pre/post ≥ 1.47	Other	ELISA
Deivanayagam et al., 1990	Conversion from negative to positive or \geq twofold rise in titre	Serum	HIA
Gendrel et al., 1988	Greater or equal than twofold rise of dilutions	Dried blood spots	HIA
Halsey et al., 1985	From negative to $\geq 1:10$	Dried blood spots	HIA
	Fourfold rise at 2 weeks, twofold rise at 3 months or conc ≥ 200 miu/ml post-vacc with <200 prevaccination		
Hussey et al., 1995		Serum	PRNT
Job et al., 1991	Greater or equal than 200 mlu/ml	Dried blood spots	PRNT
King et al., 1978	No definition given	Dried blood spots	HIA
Kumar et al., 1998	Titer ≤ 10 (NT)	Serum	PRNT
Kurubi et al., 2009	No definition given	Serum	ELISA
Lhuillier et al., 1989	No definition given	Serum	HIA
McGraw et al., 1986	Titre ≥ 10	Dried blood spots	HIA
Mirchamsy et al., 1991	Fourfold increase in HI titre	Other	HIA
Ogunmekan et al., 1981	No definition given	Other	HIA
Sabin et al., 1984	In Reference 1 (no full text available)	Red blood cells	PRNT
Sakatoku et al., 1994	Seropositive/ total samples	Serum	HIA
Simasathien et al., 1997	Positive 9 month NT and ≥ 6 month sample	Serum	PRNT
Vidyashankar et al., 2002	No definition given	Serum	ELISA
Whittle et al., 1988	No definition given	Other	PRNT
Wilkins et al., 1979	No definition given	Serum	HIA
Youwang et al., 2001	Negative to positive or \geq fourfold rise following re-immunisation	Dried blood spots	ELISA

Characteristics of studies included in the review by outcome

Table 5: Characteristics of studies included in the review by outcome

Forest plots for seroconversion

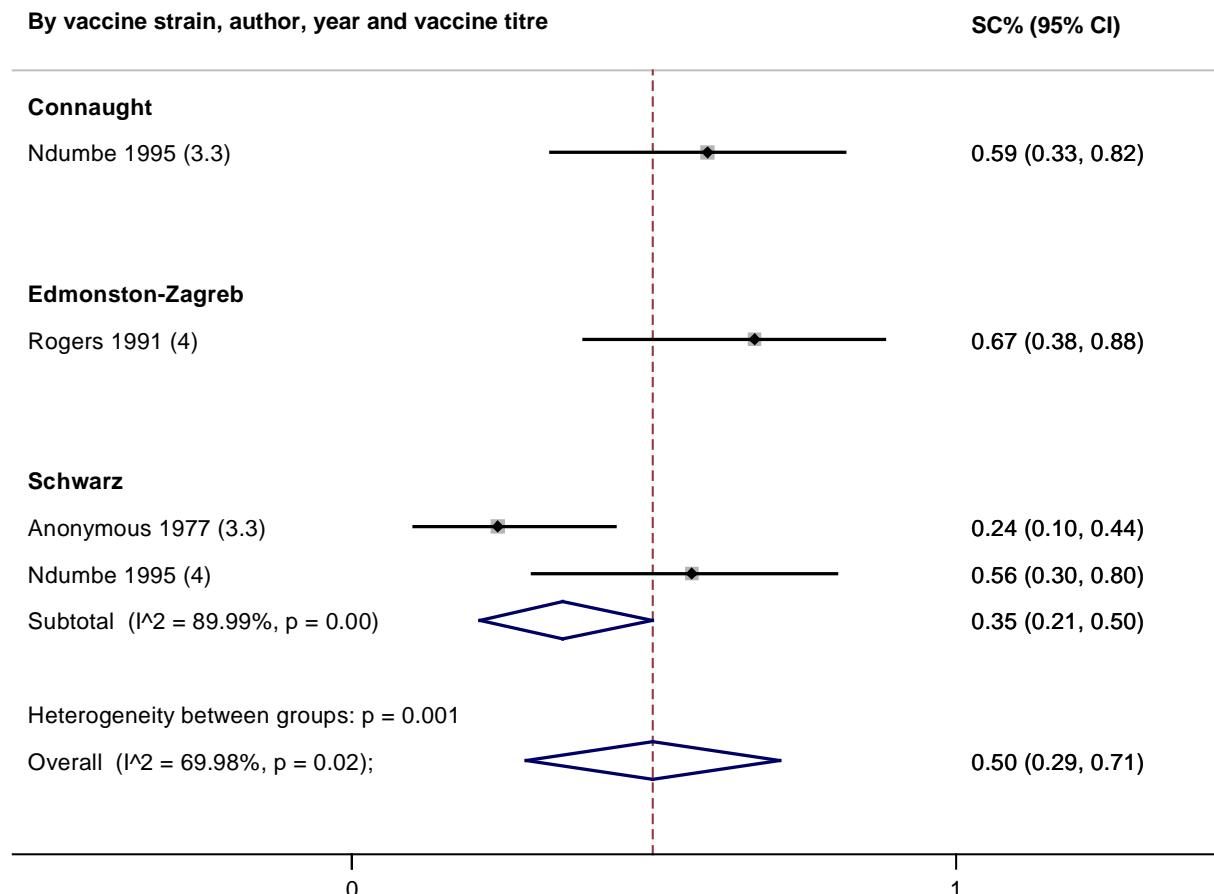

Figure 1: Random effects meta-analysis of the percentage seroconverted after MCV1 in 4-month-old infants. Titres are expressed as TCID₅₀ unless specified otherwise. SC: seroconversion. CI: confidence interval.

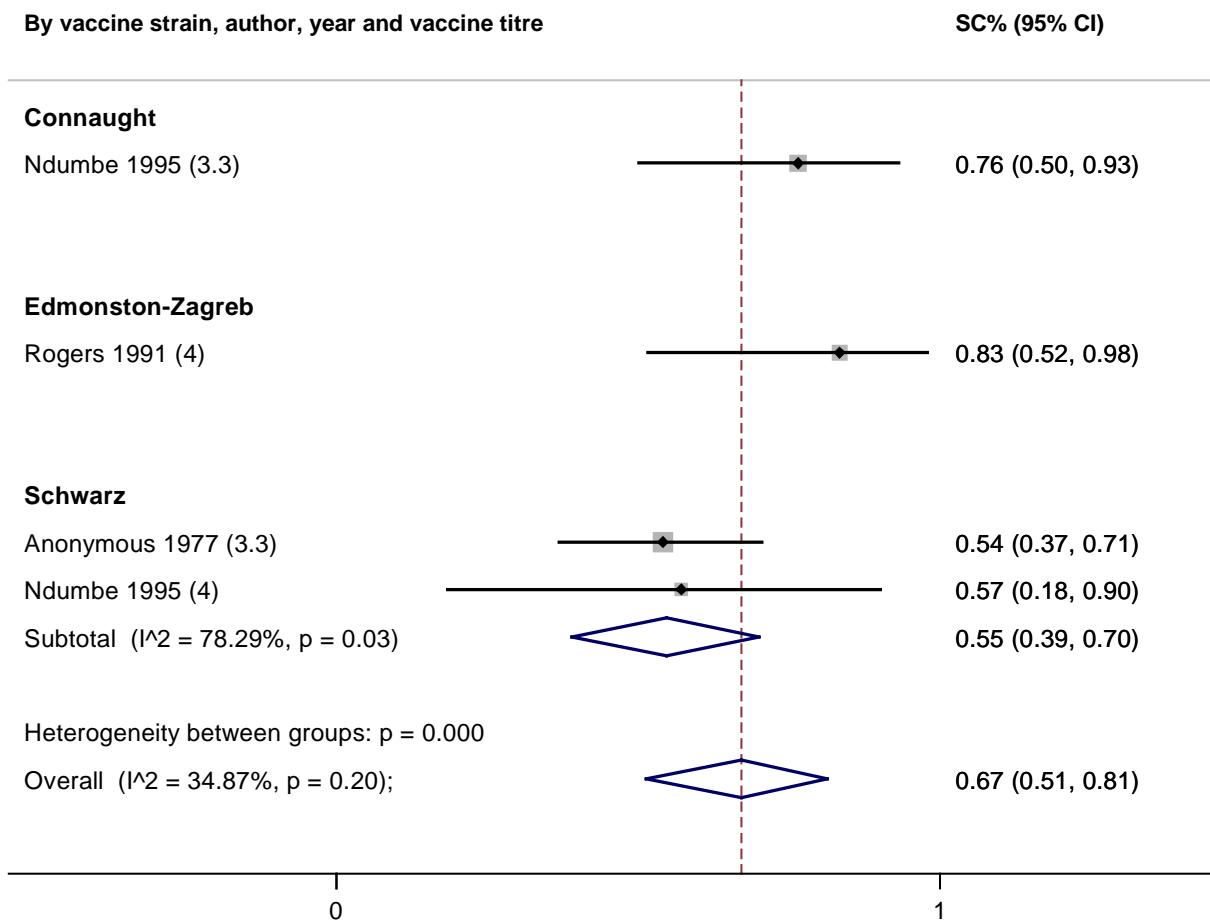

Figure 2: Random effects meta-analysis of the percentage seroconverted after MCV1 in 5-month-old infants. Titres are expressed as TCID₅₀ unless specified otherwise. SC: seroconversion. CI: confidence interval.

By vaccine strain, author, year and vaccine titre

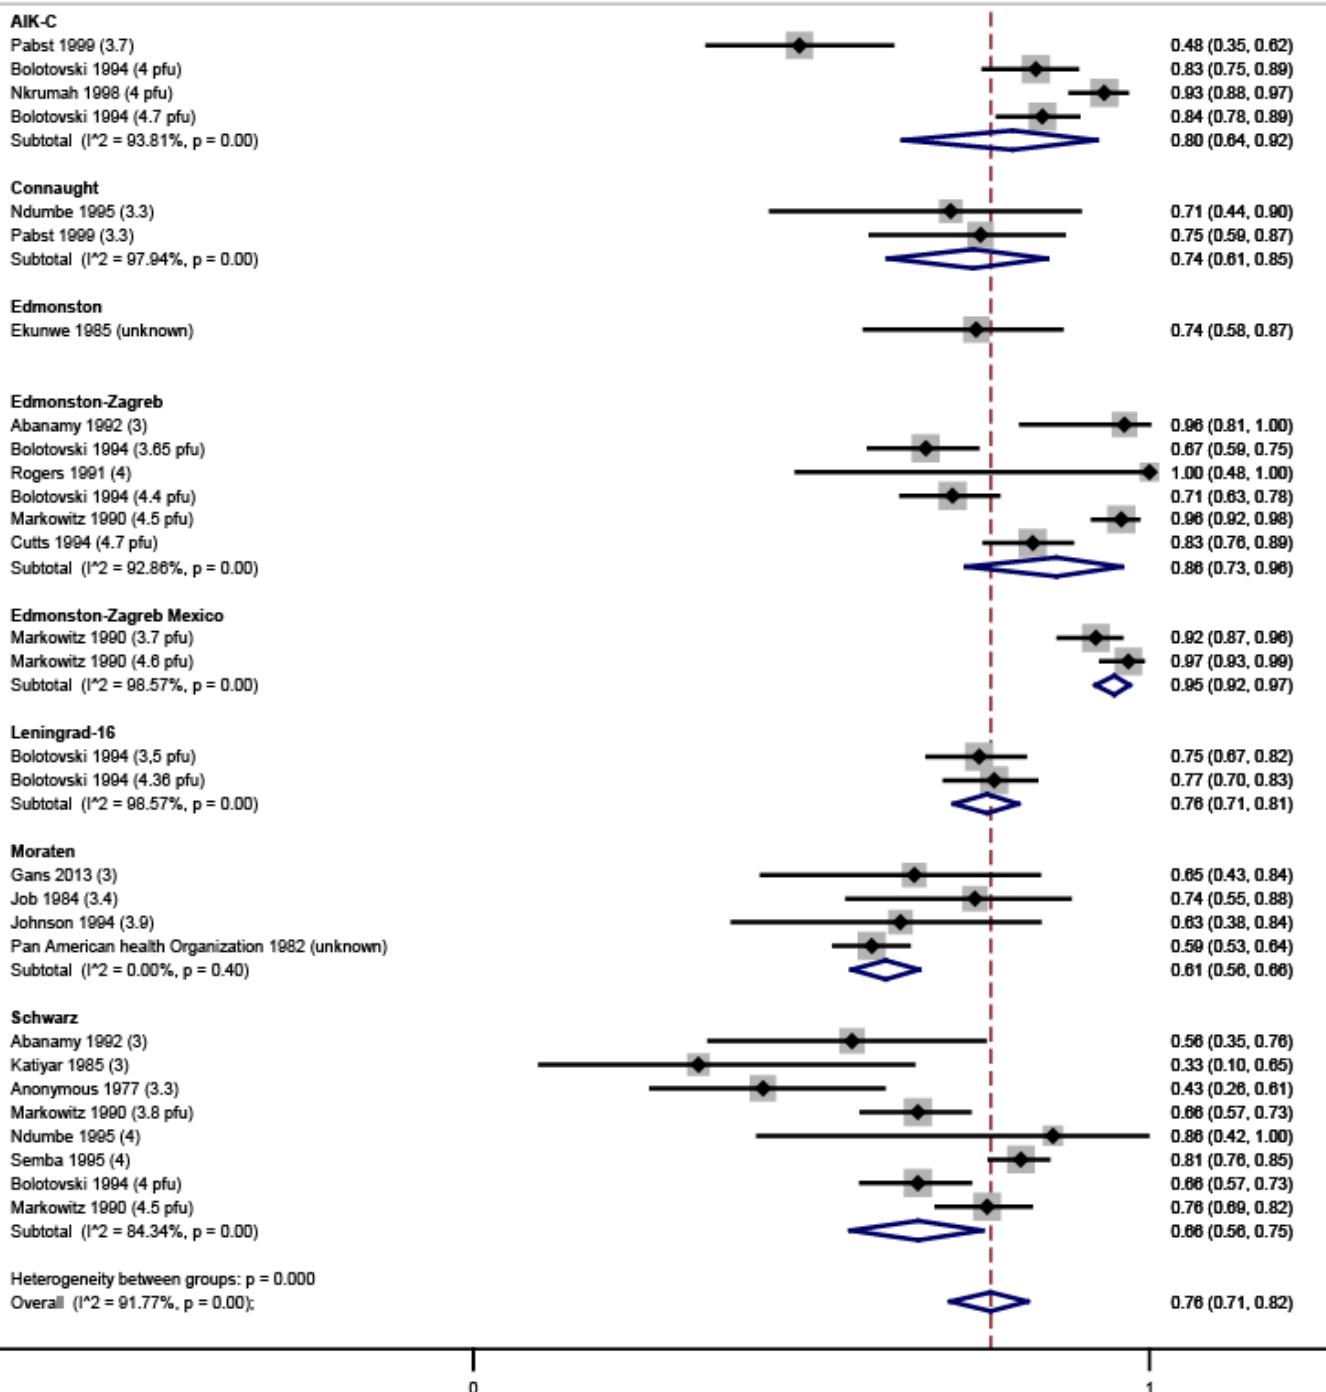

Figure 3: Random effects meta-analysis of the percentage seroconverted after MCV1 in 6-month-old infants. Titres are expressed as TCID₅₀ unless specified otherwise. SC: seroconversion. CI: confidence interval.

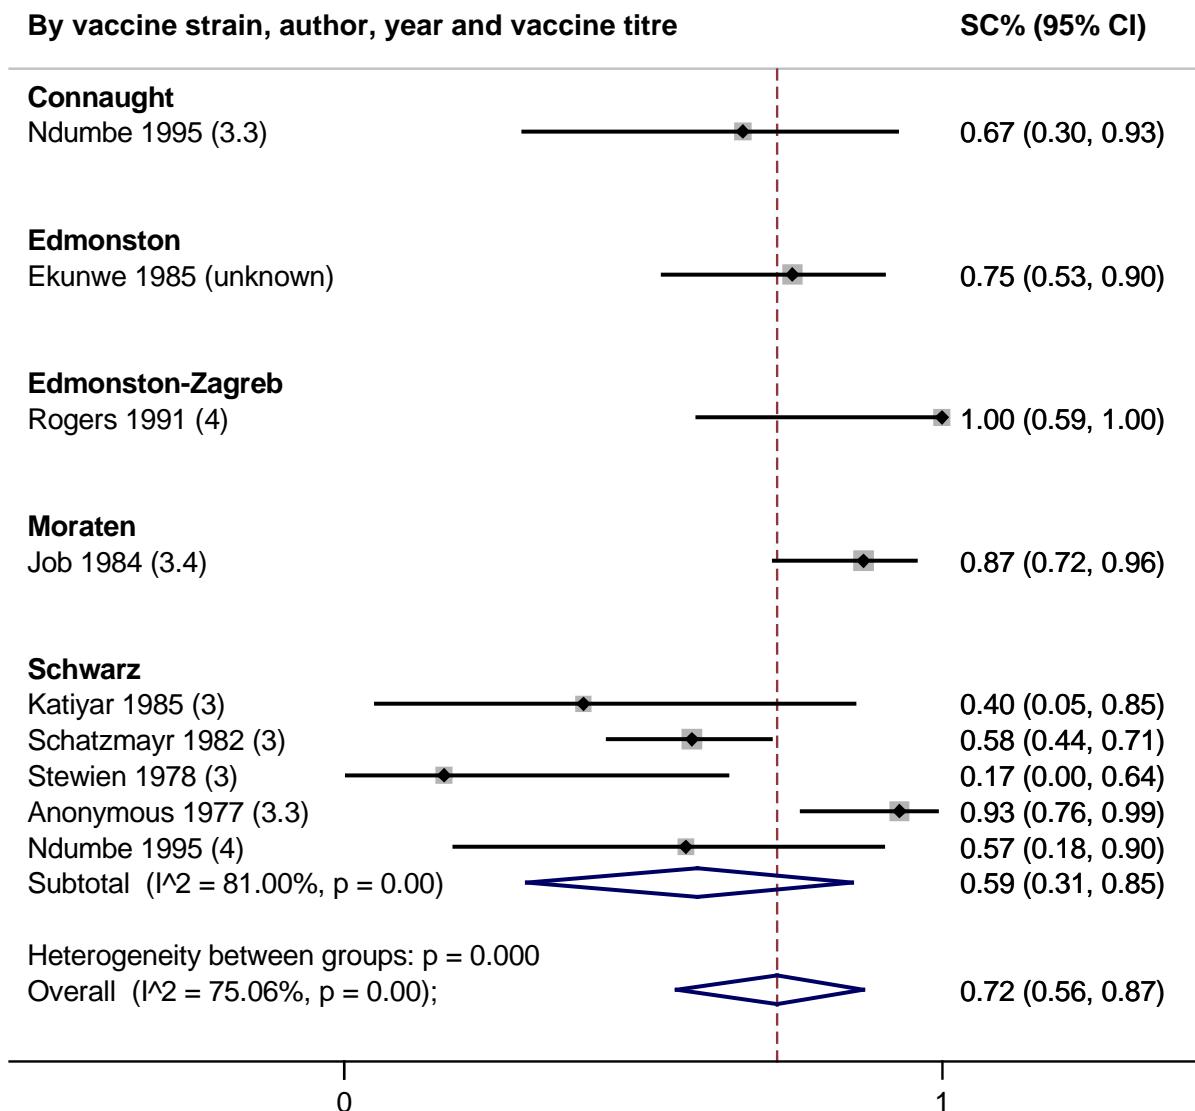

Figure 4: Random effects meta-analysis of the percentage seroconverted after MCV1 in 7-month-old infants. Titres are expressed as TCID₅₀ unless specified otherwise. SC: seroconversion. CI: confidence interval.

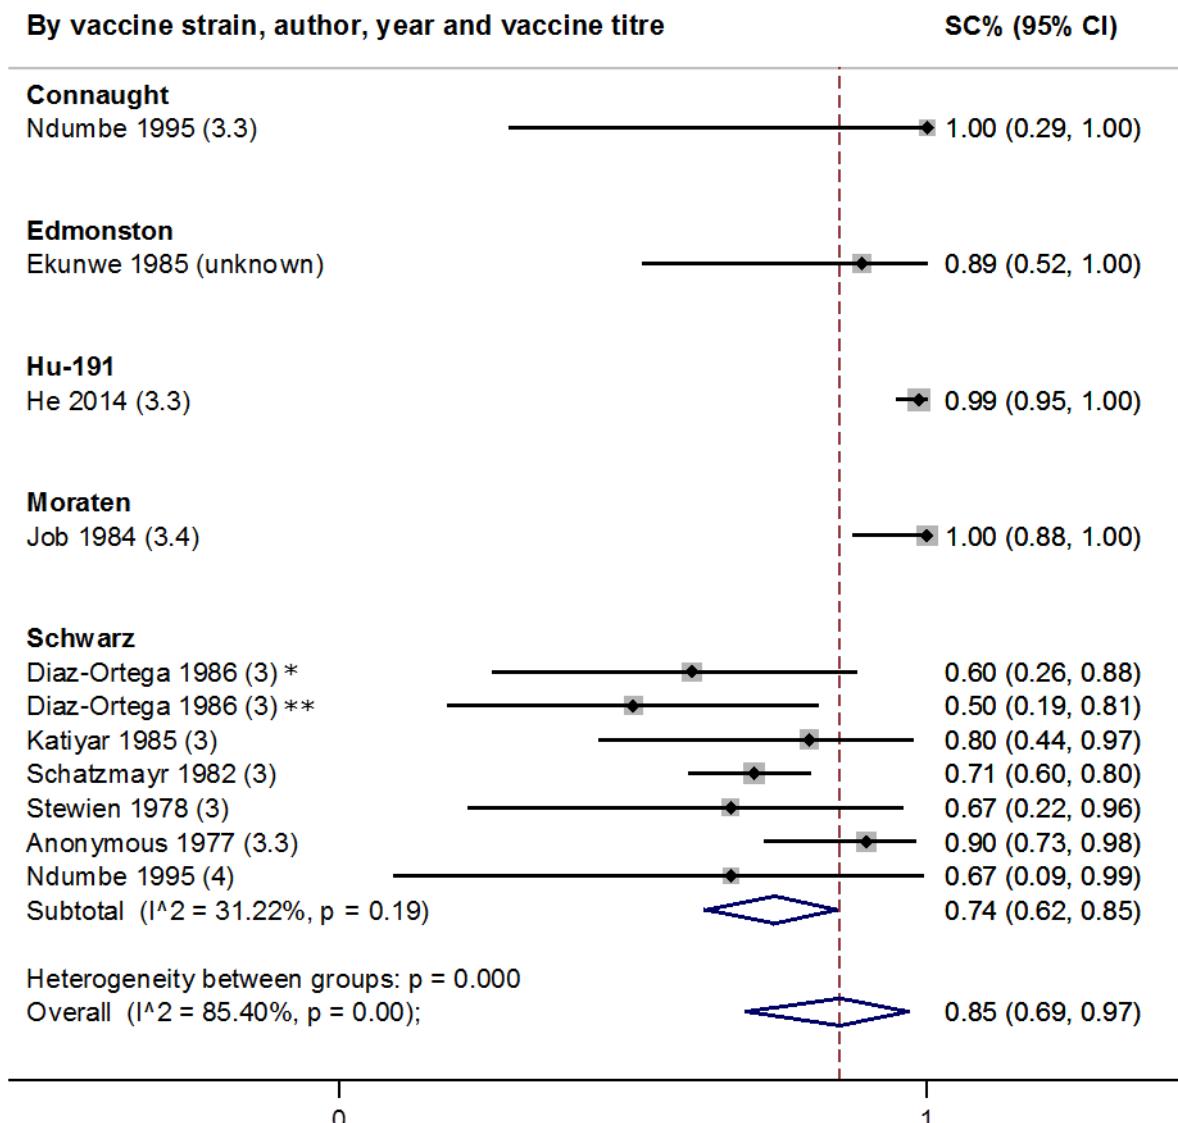

Figure 5: Random effects meta-analysis of the percentage seroconverted after MCV1 in 8-month-old infants. Titres are expressed as TCID₅₀ unless specified otherwise. SC: seroconversion. CI: confidence interval.

Diaz-Ortega 1986 examined two Schwarz vaccines (3 TCID₅₀) from *RIT and **Mérieux

Proportion seroconverted, pooled estimates per single ages and age ranges

Table 7: Sensitivity analysis of the proportion seroconverted following MCV1 <9 months pooled from meta-analysis with corresponding 95% confidence intervals (95% CI) and number of included studies presented as age ranges: a) several single ages, b) data presented as age ranges, c) a and b combined.

Age of MCV1 (months)	Seroconverted %	95% CI	Number of studies	Author, year
a) 4-5 (single)	58	44-72	3	Anonymous, 1977; Ndumbe <i>et al.</i> , 1995; Rogers <i>et al.</i> , 1991
b) 3-5 (age ranges)	55	41-69	2	Anonymous, 1981; Khanum <i>et al.</i> , 1987
c) 3-5 (combined)	56	46-66	5	Anonymous, 1977; Anonymous, 1981; Khanum <i>et al.</i> , 1987; Ndumbe <i>et al.</i> , 1995; Rogers <i>et al.</i> , 1991
a) 6-8 (single)	78	73-82	20	Abanamy <i>et al.</i> , 1992; Anonymous 1977; Bolotovski <i>et al.</i> , 1994; Cutts <i>et al.</i> , 1994; Diaz-Ortega <i>et al.</i> , 1986; Ekunwe <i>et al.</i> , 1985; Gans <i>et al.</i> , 2013; He <i>et al.</i> , 2014; Job <i>et al.</i> , 1984; Johnson <i>et al.</i> , 1994; Katiyar <i>et al.</i> , 1985; Markowitz <i>et al.</i> , 1990; Ndumbe <i>et al.</i> , 1995; Nkrumah <i>et al.</i> , 1998; Pabst <i>et al.</i> , 1999; Pan American Health Organization, 1982; Rogers 1991; Schatzmayr <i>et al.</i> , 1982; Semba <i>et al.</i> , 1995; Stewien <i>et al.</i> , 1978
b) 6-8 (age ranges)	65	50-79	4	Anonymous, 1981; Carson <i>et al.</i> , 1995; Fernandez de Castro <i>et al.</i> , 1986; Mandara <i>et al.</i> , 1985
c) 6-8 (combined)	76	72-81	24	Abanamy <i>et al.</i> , 1992; Anonymous 1977; Anonymous, 1981; Bolotovski <i>et al.</i> , 1994; Carson <i>et al.</i> , 1995;

Cutts et al., 1994; Diaz-Ortega et al., 1986; Ekunwe et al., 1985; Fernandez de Castro et al., 1986; Gans et al., 2013; He et al., 2014; Job et al., 1984; Johnson et al., 1994; Katiyar et al., 1985; Mandara et al., 1985; Markowitz et al., 1990; Ndumbe et al., 1995; Nkrumah et al., 1998; Pabst et al., 1999; Pan American Health Organization, 1982; Rogers et al., 1991; Schatzmayr et al., 1982; Semba et al., 1995; Stewien et al., 1978

Univariable meta-regression results for seroconversion

Table 8: Univariable meta-regression model of the association between seroconversion after MCV1 <9 months and age, vaccine strain, vaccine titre, decade of data collection, continent of study and type of test (N=57 observations from 20 publications)

Independent variable	Coefficient	95% CI		P value

¹ Edmonston strain was dropped because titre information was missing

TCID₅₀, 50% Tissue Culture Infective Dose; pfu, plaque-forming unit; PRNT, plaque reduction neutralization testing; ELISA, enzyme-linked immunosorbent assay; HIA, hemagglutination inhibition assay

Proportion seroconverted head-to-head comparison of 6-month-old infants vaccinated with Schwarz or Edmonston-Zagreb

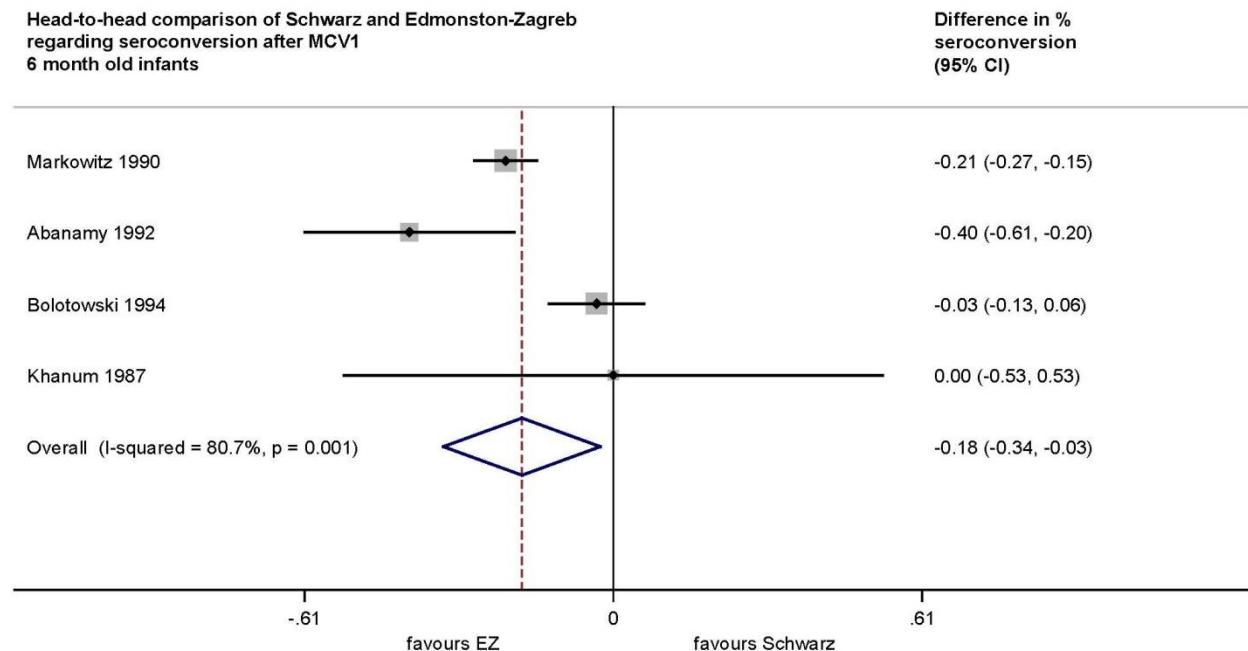

Figure 6: Random effects meta-analysis of the difference in proportion seroconverted after either Edmonston-Zagreb or Schwarz strain vaccination at 6 months of age. CI: confidence interval. EZ: Edmonston-Zagreb.

Forest plot with geometric mean titre (GMT) results from plaque reduction neutralization testing (PRNT) with accompanying confidence intervals or standard errors following MCV1 <9 months of age

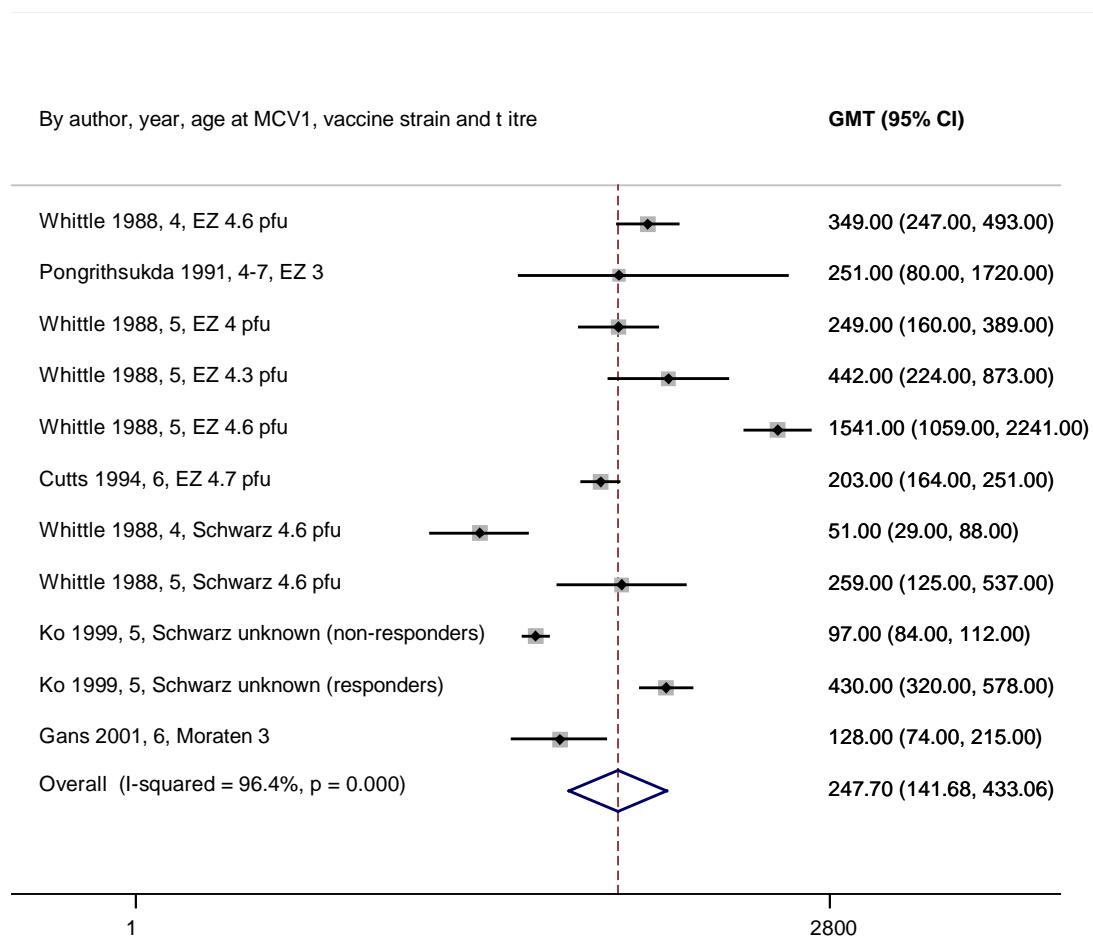

Figure 7: Random effects meta-analysis geometric mean titres with plaque reduction neutralization testing (PRNT) after MCV1 in infants aged <9 months. Titres are expressed as TCID₅₀ unless specified otherwise. GMT: geometric mean titre. CI: confidence interval.

Forest plots for safety

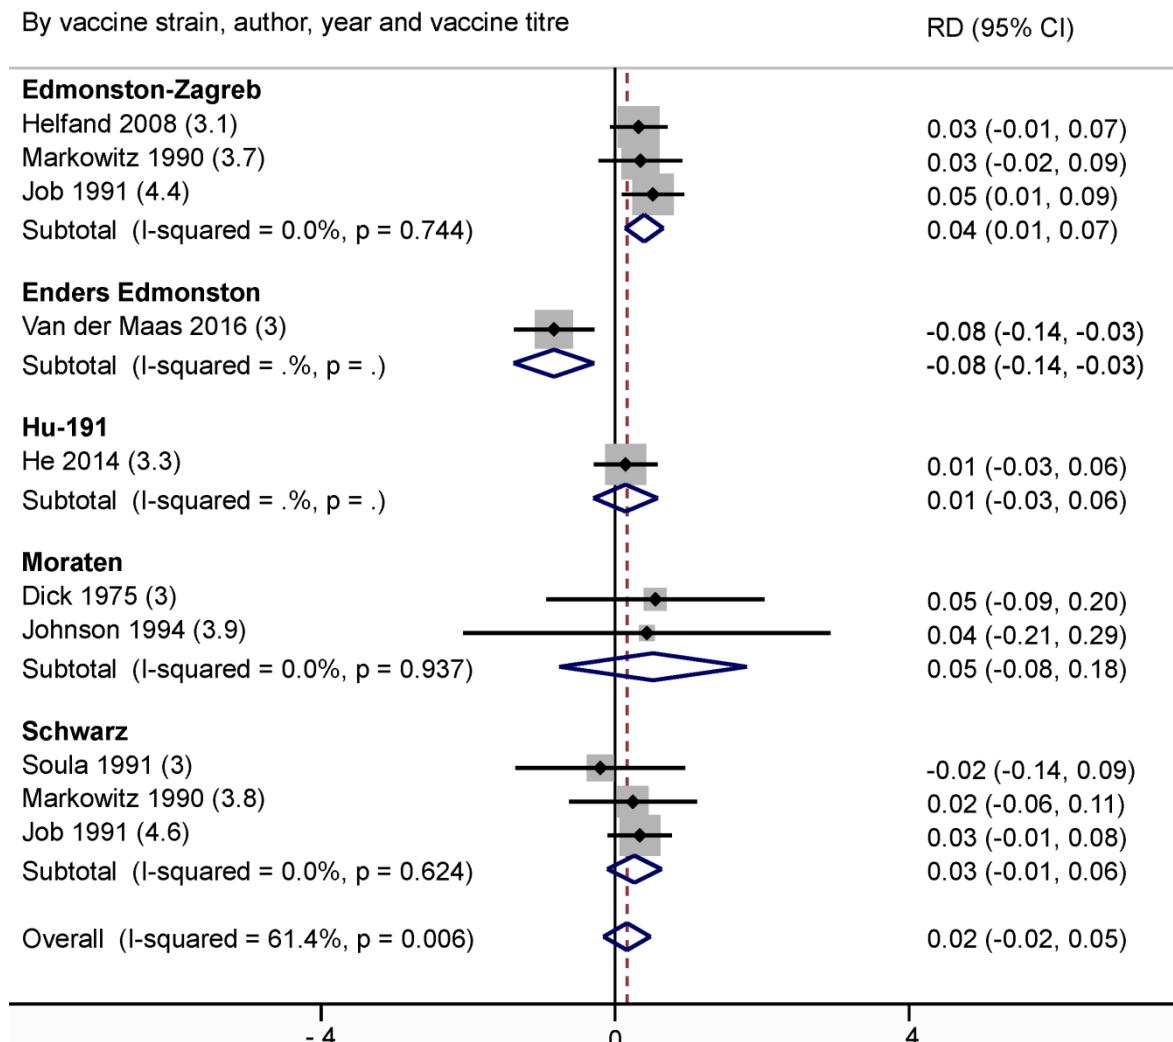

Figure 8: Random effects meta-analysis of within-study comparisons of fever after MCV1 in infants aged \geq or <9 months. Titres are expressed as TCID₅₀ unless specified otherwise. RD: risk difference. CI: confidence interval. A positive risk difference indicates a higher risk in infants <9 months of age.

By vaccine strain, author, year and titre

RD (95% CI)

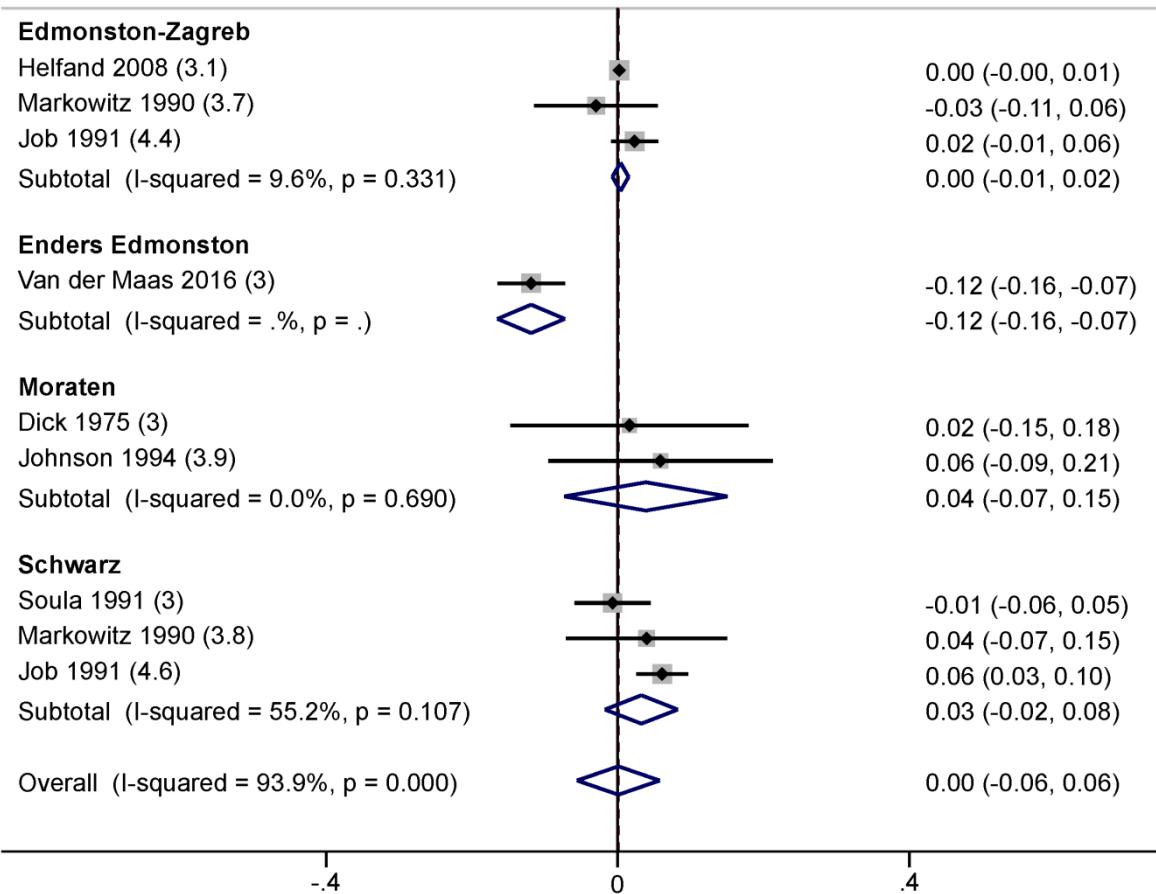

Figure 9: Random effects meta-analysis of within-study comparisons of rash after MCV1 in infants aged ≥ or <9 months. Titres are expressed as TCID₅₀ unless specified otherwise. RD: risk difference. CI: confidence interval. A positive risk difference indicates a higher risk in infants <9 months of age.

By vaccine strain, author, year and vaccine titre

RD (95% CI)

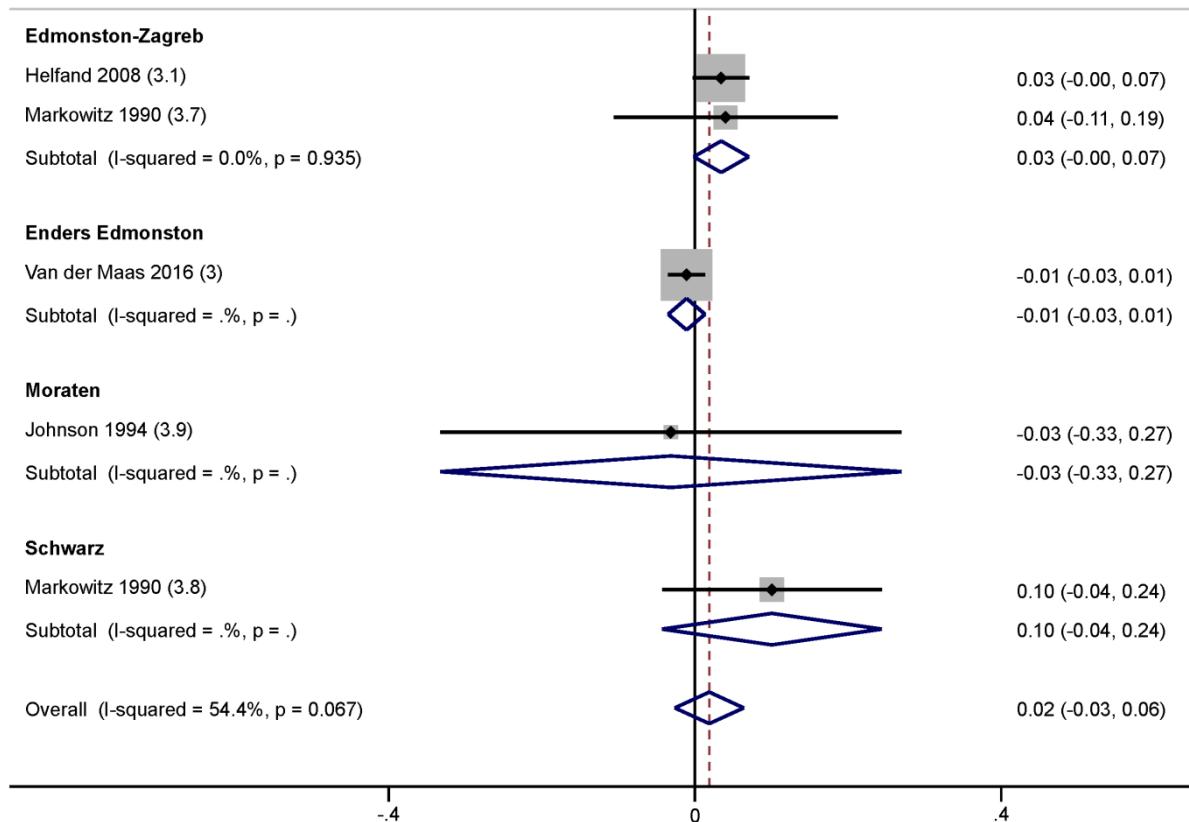

Figure 10: Random effects meta-analysis of within-study comparisons of diarrhoea after MCV1 in infants aged \geq or <9 months. Titres are expressed as TCID₅₀ unless specified otherwise. RD: risk difference. CI: confidence interval. A positive risk difference indicates a higher risk in infants <9 months of age.

By vaccine strain, author, year and vaccine titre

RD (95% CI)

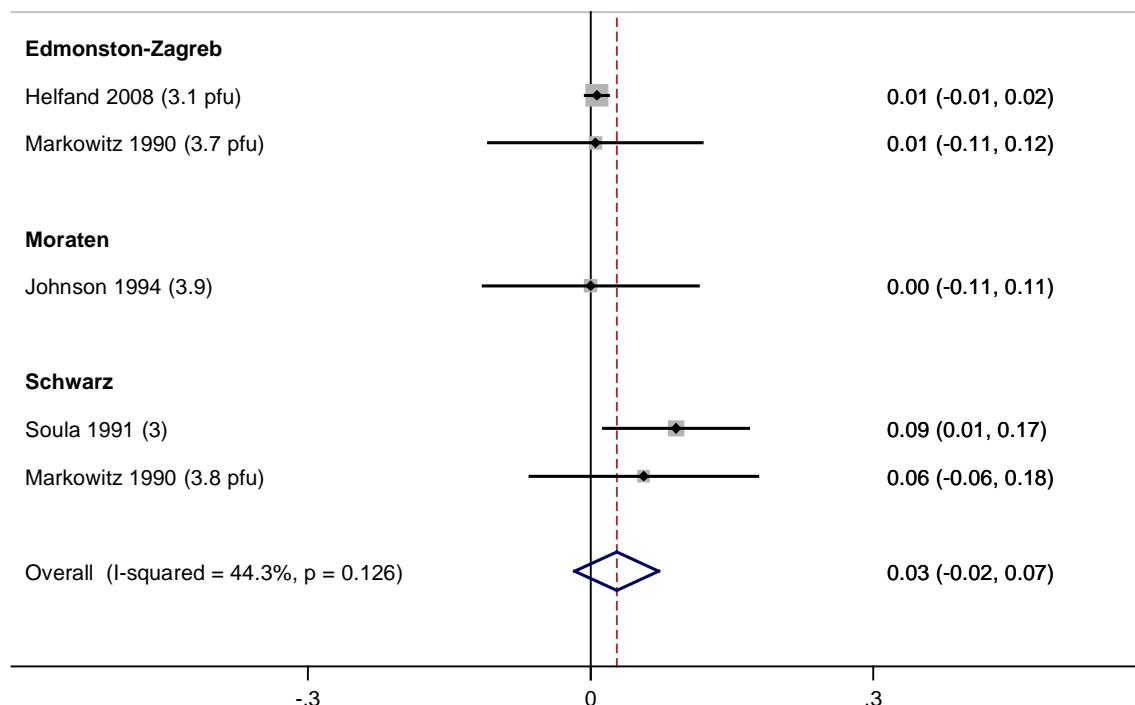

Figure 11: Random effects meta-analysis of within-study comparisons of conjunctivitis after MCV1 in infants aged \geq or <9 months. Titres are expressed as TCID₅₀ unless specified otherwise. RD: risk difference. CI: confidence interval. A positive risk difference indicates a higher risk in infants <9 months of age.

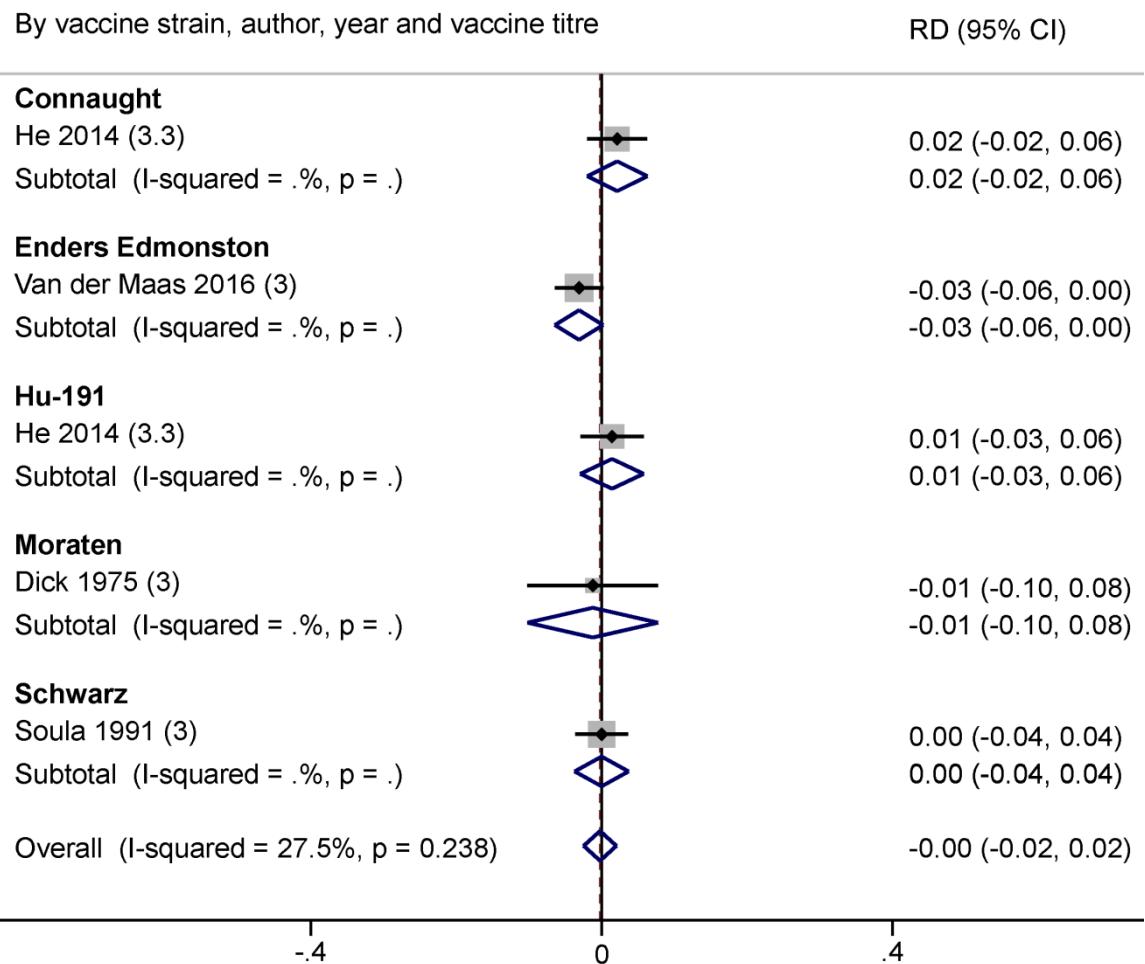

Figure 12: Random effects meta-analysis of within-study comparisons of local reactions at the injection site (redness, swelling) after MCV1 in infants aged \geq or <9 months. Titres are expressed as TCID₅₀ unless specified otherwise. RD: risk difference. CI: confidence interval. A positive risk difference indicates a higher risk in infants <9 months of age.

GRADE summary of evidence table

Table 10: GRADE summary of evidence table

No of studies	Design	Quality assessment					Other considerations	Summary of findings				Importance	
		Limitations	Inconsistency	Indirectness	Imprecision	Intervention		No of patients	Effect	Quality	Absolute (95% CI)		
Immunogenicity													
23	Observational	No serious limitations	No serious inconsistency	No serious indirectness	Serious ¹	Many studies had high loss to follow-up. Dose-response gradients for age and seroconversion.	#	#	#	#	⊕⊕○○ Low	IMPORTANT	
12	RCT	No serious limitations	No serious inconsistency	No serious indirectness	Serious ¹	Lack of methodological information.	#	#	#	#	⊕⊕⊕○ Moderate	IMPORTANT	
Duration of immunity													
2	Observational	No serious limitations	No serious inconsistency	No serious indirectness	No serious imprecision	Very few studies available.	#	#	#	#	⊕⊕○○ Low	IMPORTANT	
1	RCT	No serious limitations	No serious inconsistency	No serious indirectness	No serious imprecision	Lack of methodological information.	#	#	#	#	⊕⊕⊕○ Moderate	IMPORTANT	
Vaccine effectiveness/ efficacy													
9	Observational	Serious limitations ²	No serious inconsistency	No serious indirectness	Serious ¹	Very few studies available. Heterogeneity between studies.	#	#	#	#	⊕○○○ Very low	IMPORTANT	
2	RCT	No serious limitations	No serious inconsistency	No serious indirectness	No serious imprecision	Lack of methodological information.	#	#	#	#	⊕⊕⊕○ Moderate	IMPORTANT	
Safety													
5	Observational	Serious limitations ³	No serious inconsistency	No serious indirectness	No serious imprecision	In many studies, clear case definitions (e.g. for fever) are lacking.	#	#	#	#	⊕○○○ Very low	IMPORTANT	
10	RCT	Serious limitations ³	No serious inconsistency	No serious indirectness	No serious imprecision	Lack of methodological information. In many studies, clear case definitions (e.g. for fever) are lacking.	#	#	#	#	⊕⊕○○ Low	IMPORTANT	

1: very wide confidence intervals;

2: mainly due to lack of laboratory confirmation of measles cases;

3: most studies lack an unvaccinated control group of the same age; this is important for safety results because fever and rash occur more often in younger infants due to other causes.

#: summary estimates per intervention or control group are not applicable

Multivariable meta-regression results for seroconversion in the absence or presence of maternal antibodies

Table 11. Multivariable meta-regression of the association between seroconversion after MCV1 <9 months in the absence or presence of maternal antibodies, adjusted for age. (N=66 observations from 16 publications)

Independent variable	Coefficient	95% CI		P value
		Lower limit	Upper limit	
Age at MCV1 (months)	0.0689	0.0164	0.1213	0.011
<u>Maternal antibodies</u>				
Absence of maternal antibodies	Reference	-	-	-
Presence maternal antibodies	-0.3317	-0.4557	-0.2078	<0.001
