#### **General Information**

All of the reactions were carried out under argon atmosphere using oven-dried glassware. Super dry dichloroethane (DCE), ethyl diazoacetate, indoles, phosphine ligand, and metal catalysts were purchased from chemical companies and were used without further treatment. Flash column chromatography was performed using a silica gel (300-400 mesh). Analytical thin-layer chromatography was performed using glass plates precoated with 200-300 mesh silica gel impregnated with a fluorescent indicator (254 nm). All of the new compounds were fully characterized. <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded in CDCl<sub>3</sub> or DMSO-*d*<sub>6</sub> using a 400/600 MHz spectrometer, and chemical shifts are reported in ppm with the solvent signals as the reference, and coupling constants (*J*) are given in Hz. The peak information is described as: s = singlet, br = broad, d = doublet, t = triplet, q = quartet, m = multiplet, and comp = composite. High-resolution mass spectra (HRMS) were recorded using a commercial apparatus (ESI Source).

#### **Experimental Procedures** General Procedure for the Preparation of Diazo Compounds 1a - 1u, related to Scheme 1.

<u>Synthesis of 1-(bromomethyl)-2-(phenylethynyl)benzene</u>: To a solution of (2-iodophenyl)methanol (9.36 g, 40.0 mmol), Pd(PPh<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub> (280.8 mg, 1.0 mol %), CuI (76.2 mg, 1.0 mol%) in Et<sub>3</sub>N (40.0 mL), was added a solution of phenylacetylene (4.91 g, 48.0 mmol) in Et<sub>3</sub>N (20.0 mL) slowly at 0 °C under argon atmosphere. The reaction mixture was stirred overnight and the reaction temperature was warmed to room temperature slowly. Upon completion (monitored by TLC), the solvent was evaporated under vacuum after filtering through Celite, and the obtained (2-(phenylethynyl)phenyl)methanol was directly used for the next step without further purification.

To a 100 mL oven-dried round-bottom flask containing a magnetic stirring bar, triphenylphosphine (12.60 g, 48.0 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (40.0 mL), was added bromine (7.67 g, 48.0 mmol) dropwise, and the mixture was stirred vigorously at ambient temperature for 30 min. Then a solution of the above obtained product in CH<sub>2</sub>Cl<sub>2</sub> (16.0 mL) was added to the reaction mixture dropwise and the reaction mixture was stirred for additional 1 hour. *n*-Hexane (40.0 mL) was then added to quench the reaction, and the solvent was evaporated under vacuum after filtering through Celite. The residue was purified by flash chromatography on Al<sub>2</sub>O<sub>3</sub> (ethyl acetate/petroleum ether = 1/20) to afford the product 1-(bromomethyl)-2-(phenylethynyl)benzene (9.65 g, 89 % based on (2-iodophenyl)methanol).

**Synthesis of 1a:** To a 100 mL oven-dried round-bottom flask containing a magnetic stirring bar, sodium hydride (60 % dispersion in mineral oil, 0.60 g, 15.0 mmol) in dry THF (30 mL), was added methyl acetoacetate (1.74 g, 15.0 mmol) dropwise at 0 °C under nitrogen atmosphere. After the mixture turned clear, a solution of 1-(bromomethyl)- 2-(phenylethynyl)benzene (2.71 g, 10.0 mmol) in THF (10.0 mL) was added dropwise at ambient temperature, and the reaction was refluxed for 4 hours. Saturated NH<sub>4</sub>Cl (20.0 mL) was added to quench the reaction, the organic phase was separated, and the aqueous layer was extracted with Et<sub>2</sub>O ( $3 \times 20.0$  mL). The combined organic layers were washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. The solvent was evaporated under vacuum after filtration, and the residue was directly used for the next step without further purification.

To a 50-mL oven-dried flask containing a magnetic stirring bar, the above obtained crude product, 4-acetamidobenzenesulfonyl azide (*p*-ABSA, 2.89 g, 12.0 mmol) in DCM (20.0 mL), was added a solution of 1,8-diazabicyclo[5.4.0] undec-7-ene (DBU, 2.29 mg, 15.0 mmol) in DCM (5.0 mL) slowly at 0 °C. The reaction mixture was

stirred at 0 °C for 12 hours. Upon completion (monitored by TLC), the solvent was evaporated under vacuum after filtering through Celite, and the resulting residues was purified by column chromatography on silica gel (ethyl acetate/petroleum ether = 1/10) to give the pure diazoacetate **1a** (2.06 g, 71% yields based on 1-(bromomethyl)-2-(phenylethynyl)benzene).

The synthesis of other substrates (1b-1u) is similar to that of 1a.

#### The preparation of diazo compounds 4a – 4e, related to Scheme 1.

**Synthesis of 4a**: To a solution of ethyl diazoacetate (EDA, 1.37 g, 12.0 mmol) in CH<sub>3</sub>CN (10.0 mL), a solution of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU 1.53 g, 10.0 mmol) and 2-(phenylethynyl)benzaldehyde (2.07 g, 10.0 mmol) in CH<sub>3</sub>CN (10.0 mL) were added in sequence at 0 °C under nitrogen atmosphere. After the mixture was stirred at 0 °C for 15 hours, the reaction was quenched with saturated aqueous NaHCO<sub>3</sub> and then extracted with CH<sub>2</sub>Cl<sub>2</sub> ( $3 \times 20.0$  mL). The combined organic phase was dried over Na<sub>2</sub>SO<sub>4</sub> and the solvent was evaporated under vacuum after filtration. The resulting residues was purified by flash column chromatography on silica gel (ethyl acetate/petroleum ether = 1/3) to afford the pure diazoacetate **4a** (2.85 g, 89% yield based on 2-(phenylethynyl)benzaldehyde).

The synthesis of other substrate 4g is similar to that of 4a.

**Synthesis of 4b**: To a solution of diazoacetate **4a** (0.32 g, 1.0 mmol) and 4-toluenesulfonyl chloride (TsCl, 0.19 g, 1.0 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (5.0 mL), and triethylamine (0.12 g, 1.2 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (1.0 mL) were added in sequence at 0 °C under argon atmosphere. After the mixture was stirred at 0 °C for 15 hours, the reaction was quenched with saturated aqueous NH<sub>4</sub>Cl and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 × 5.0 mL). Then the combined organic phase was washed with brine and dried over Na<sub>2</sub>SO<sub>4</sub>. The solvent was removed in vacuo after filtration, and the resulting residues was purified by flash column chromatography on silica gel (ethyl acetate/petroleum ether = 1/10) to afford the pure diazoacetates **4b** (370 mg, 78% yield based on **4a**). The synthesis of other substrates (**4c-4e**) is similar to that of **4b**.

### The preparation of diazo compound 4f, related to Scheme 1.

**Synthesis of 4f:** To a solution of 2-alkynylbenzaldehyde **S-6** (412.5 mg, 2.0 mmol), arylsulfonamide (342.5mg, 2.0 mmol) and triethylamine (506.0 mg, 5.0 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (10.0 mL), was added titanium tetrachloride (455.2 mg, 2.4 mmol) at 0 °C under argon atmosphere. The reaction mixture was stirred under these conditions for 12 h, and then quenched with brine. The aqueous phase was extracted with CH<sub>2</sub>Cl<sub>2</sub> (10.0 mL X 2), and the combined organic layers were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated in vacuo after filtration, and the resulting residues was purified by recrystallization (solvents: CH<sub>2</sub>Cl<sub>2</sub>/petroleum ether = 5 : 1) to afford 432.0 mg of S-7 in 60% yield (based on S-6).

To a solution of ethyl diazoacetate (0.14 g, 1.2 mmol) in anhydrous CH<sub>3</sub>CN (1.0 mL), was added a solution of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU, 0.15 g, 1.0 mmol) in anhydrous CH<sub>3</sub>CN (1.0 mL) and S-7 (0.36 g, 1.0 mmol) in anhydrous CH<sub>3</sub>CN (1.0 mL) in sequence at 0 °C under nitrogen atmosphere. After the mixture was stirred at room temperature for 15 h, the reaction was quenched with saturated aqueous NaHCO<sub>3</sub> and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 X 5.0 mL). Then the combined organic phase was washed with brine and dried over Na<sub>2</sub>SO<sub>4</sub>. The solvent was removed in vacuo after filtration, and the precipitated solid was washed with petroleum ether (6.0 mL X 2). Then the solid was dried under vacuum to give the corresponding diazoacetate **4f**

To a 50-mL oven-dried flask containing a magnetic stirring bar, **4g** (2.38 g, 6.8 mmol, prepared according to the above method for **4a**) in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) was added MnO<sub>2</sub> (8.88 g, 102.0 mmol) at 25 °C, and the reaction mixture was stirred under this condition for 12 hours. After the reaction was finished, the mixture was filtered through a short pad of silica, then the solvent was evaporated under reduced pressure and the residue was purified by flash column chromatography on silica gel (ethyl acetate/petroleum ether = 1/10) to give pure diazoacetate **14** (2.0 g, 85% yield based on **4g**). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) ( $\delta$ , ppm) 7.53-7.51 (m, 1H), 8.45-8.35 (comp, 5H), 6.89-6.85 (m, 2H), 4.15 (q, J = 7.1 Hz, 2H), 3.80 (s, 3H), 1.09 (t, J = 7.1 Hz, 3H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) ( $\delta$ , ppm) 187.4, 161.1, 160.0, 140.4, 133.1, 131.9, 130.5, 127.9, 127.2, 121.5, 114.8, 114.1, 94.3, 85.5, 61.7, 55.3, 14.0. ### General Procedure for the Optimization of Ligands, related to Table S2.

The **Ln**AuCl complex (0.01 mmol) and AgSbF<sub>6</sub> (3.34mg, 0.01 mmol) were suspended in DCE (0.5 mL). The reaction was stirred at room temperature for 2.0 hours. The solvent was evaporated and the mixture dissolved in 0.5 mL of DCE. Then the mixture was filtered through a pad of Celite, which was added into a solution of **1a** (58mg, 0.2mmol) in DCE (0.5 mL) at 25 °C for 12.0 hours. Afterwards, 1,3,5-trimethoxybenzene (16.8 mg, 0.1mmol) was added into the reaction mixture, and yield determined by proton *NMR* using 1,3,5-trimethoxybenzene as the internal standard. E.g., "L1, 0%; 89%" is equal to "L1AuCl, 0% **2a**; 89% **3a**".

General Procedure for the Gold-Catalyzed Aromatization, related to Scheme1 Method A

A solution of diazoacetate **1** or **4** (0.2 mmol) in 1,2-dichloroethane (2.0 mL) was added over 5 min to a 10-mL oven-dried flask containing a magnetic stirring bar, and JohnphosAu(CH<sub>3</sub>CN)SbF<sub>6</sub> (7.7 mg, 0.01 mmol, 5.0 mol %) in dry 1,2-dichloroethane (2.0 mL) using a syringe at room temperature under argon atmosphere. After the addition, the reaction mixture was stirred at 25 °C for 12 hours. Then, the solvent was removed under reduced pressure and the crude product was purified by column chromatography on a silica gel (solvents: ethyl acetate/petroleum ether = 1/10) to afford the pure naphthalene derivatives **2** or **5** in 62%-94% yields.

(The experimental procedure for the synthesis of **6** is same to that mentioned above in Method A, related to **Figure 2A**.)

#### Method B

A solution of diazoacetate **14** (69.6 mg, 0.2 mmol) in dry 1,2-dichloroethane (2.0 mL) was added over 5 min to a 10-mL oven-dried flask containing a magnetic stirring bar, JohnphosAu (CH<sub>3</sub>CN)SbF<sub>6</sub> (7.7 mg, 0.01 mmol, 5.0 mol %), and nucleophiles (0.3 mmol, 1.5 equiv) in dry 1,2-dichloroethane (2.0 mL) using a syringe at room temperature under argon atmosphere. After the addition, the reaction mixture was stirred at 60 °C for 3 hours (performed for 12 h in the case of **15i**). Then, the solvent was removed under reduced pressure and the crude product was purified by column chromatography on a silica gel (solvents: ethyl acetate/petroleum ether = 1/10 to 1/5) to afford the pure products **15** in 53%-94% yields.

The Preparation of  $\pi$ -conjugated polycyclic hydrocarbons (CPHs), related to Figure 2B.

Synthesis of **7a**: To a 50-mL oven-dried round-bottom flask containing a magnetic stirring bar, **2a** (52.5 mg, 0.2 mmol) was added sulphuric acid (8.0 ml) in 5 min at 0 °C. The reaction mixture was stirred overnight and the reaction temperature was warmed to room temperature slowly. Then, water (50 mL) was added to the reaction mixture and the reaction mixture was stirred for 1-2 h. The yellow solid precipitated out and was filtered under vacuum. The crude product was purified by column chromatography on silica gel (solvents: petroleum ether/ethyl acetate = 20 : 1) to afford 38.7 mg **7a** in 84% yield. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) ( $\delta$ , ppm) 8.17 (s, 1H), 7.94 – 7.78 (comp, 3H), 7.77 – 7.68 (comp, 2H), 7.59 – 7.51 (comp, 2H), 7.50 – 7.43 (m, 1H), 7.37 – 7.32 (m, 1H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) ( $\delta$ , ppm) 193.3, 145.0, 138.5, 137.1, 136.3, 135.2, 133.8, 132.9, 131.0, 129.3, 129.1, 128.9, 127.1, 125.8, 124.6, 121.1, 119.2.
