

Supplemental Table 3 Results from simple linear regression analysis of PCS and MCS ten years after a *Giardia*-outbreak with IBS, CF and Exposure status as independent variables after three, six and ten years, respectively

Regression model	Outcome	3 years	6 years	10 years
		P-value for effect of status as exposed		
Exposure status, IBS, CF	PCS	.99	.37	.26
	MCS	.28	.002	.14
		P-value for interaction-term		
Exposure status, IBS, CF,	PCS	.97	.42	<.001
Exposure statusxCF	MCS	.57	.50	.027

PCS = Physical component summary (0-100); MCS = Mental component summary (0-100); IBS = Irritable bowel syndrome; CF = Chronic fatigue; Exposure status= Status as exposed or control

Non-significant p-values are highlighted
