## *Fourier Transform Infrared (FTIR) Spectroscopy*

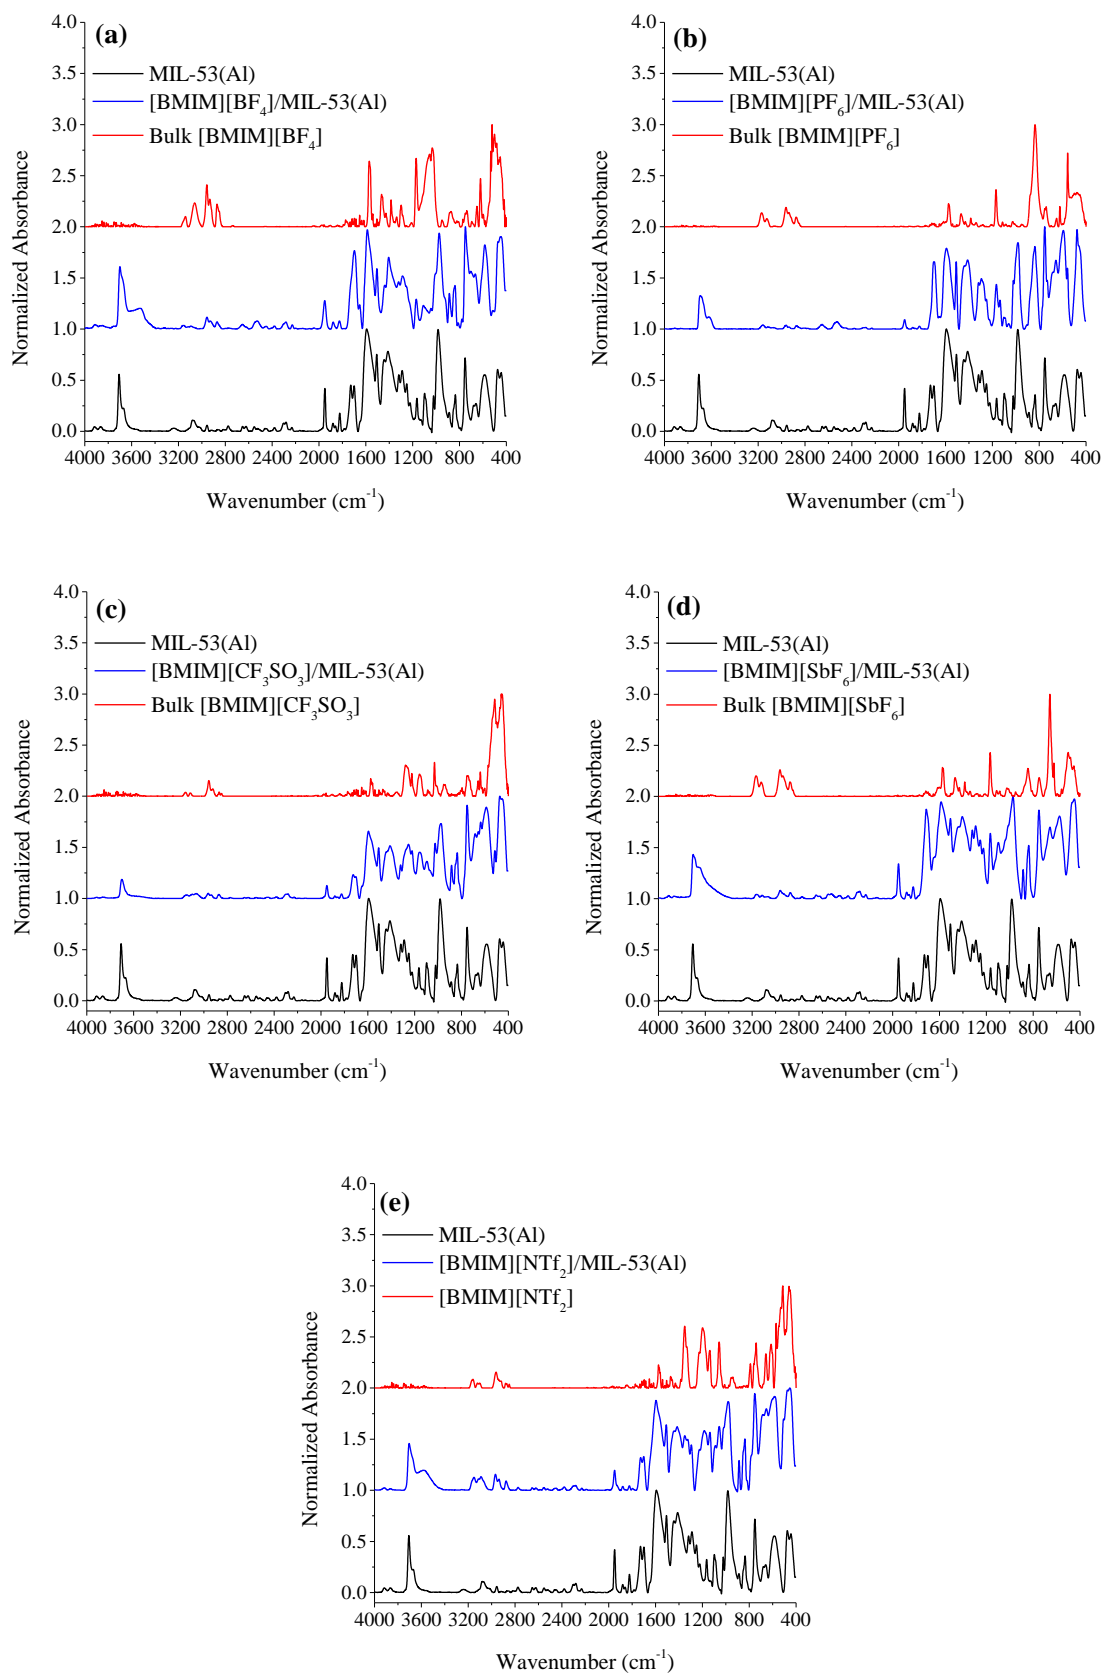

All IL/MIL-53(Al) composites showed the characteristic IR features of their ILs in the region of 3200-2800  $\text{cm}^{-1}$ . The data indicate red or blue shifts on the peak positions of these features from their corresponding positions in bulk materials. For instance, the symmetric stretching vibration of C(4)HC(5)H,  $\nu_{\text{ss}}(\text{C}(4)\text{HC}(5)\text{H})$ , of the imidazolium ring showed red shifts of 3 and 7  $\text{cm}^{-1}$  for [BMIM][BF<sub>4</sub>]/MIL-53(Al) and [BMIM][PF<sub>6</sub>]/MIL-53(Al), respectively.  $\nu_{\text{ss}}(\text{C}(4)\text{HC}(5)\text{H})$  of [BMIM][CF<sub>3</sub>SO<sub>3</sub>]/MIL-53(Al) showed a blue shift of 4  $\text{cm}^{-1}$ , while for [BMIM][SbF<sub>6</sub>]/MIL-53(Al) and [BMIM][NTf<sub>2</sub>]/MIL-53(Al) the shifts were in the spectral resolution. The most acidic H atom in the [BMIM]<sup>+</sup> is bonded to the C atom between two N atoms in the imidazolium ring. Therefore,  $\nu(\text{C}(2)\text{-H})$  vibration is a good indicator of the interactions between anion and cation, and IL and MOF. For [BMIM][BF<sub>4</sub>]/MIL-53(Al) and [BMIM][PF<sub>6</sub>]/MIL-53(Al),  $\nu(\text{C}(2)\text{-H})$  red-shifted by 5 and 6  $\text{cm}^{-1}$ , respectively, while it was red-shifting by 8  $\text{cm}^{-1}$  for both [BMIM][SbF<sub>6</sub>]/MIL-53(Al) and [BMIM][NTf<sub>2</sub>]/MIL-53(Al). The  $\nu(\text{C}(2)\text{-H})$  vibration red-shifted from 3115 to 3101  $\text{cm}^{-1}$  in [BMIM][CF<sub>3</sub>SO<sub>3</sub>]/MIL-53(Al) composite. A similar behavior of  $\nu(\text{C}(4)\text{HC}(5)\text{H})$  and  $\nu(\text{C}(2)\text{-H})$  vibrations of IL/MIL-53(Al) composites might be reasonable as both C(4)HC(5)H and C(2)-H are involved in H bonding between anion and cation, and both are the indicators of interionic interactions.<sup>[5]</sup> As given in Table S6, [BMIM]<sup>+</sup> originated IR spectra of IL/MIL-53(Al) composites demonstrated that IL-MOF interaction depends on the type of IL. Anion related peaks could help to understand the anion-cation and IL-MOF interactions in a clearer way. Antisymmetric stretching vibrations of [BF<sub>4</sub>]<sup>-</sup> and [PF<sub>6</sub>]<sup>-</sup>,  $\nu_{\text{as}}(\text{BF}_4)$  and  $\nu_{\text{as}}(\text{PF}_6)$ , red-shifted by 8 and 6  $\text{cm}^{-1}$  in [BMIM][BF<sub>4</sub>]/MIL-53(Al) and [BMIM][PF<sub>6</sub>]/MIL-53(Al), respectively. In the composites prepared by incorporating [BMIM][BF<sub>4</sub>] and [BMIM][PF<sub>6</sub>] into MIL-53(Al), the corresponding  $\nu(\text{C}(2)\text{-H})$  bands red-shifted, indicate the lengthening of the bond between C(2) and H. This change suggests that hydrogen bonding between anion and cation gets stronger as consistent with the literature.<sup>[6]</sup> This strengthening in the hydrogen bond between anion and cation weakens the  $\nu_{\text{as}}(\text{BF}_4)$  and  $\nu_{\text{as}}(\text{PF}_6)$  vibrations. MOF-originated IR peaks of these composites showed that  $\nu_{\text{ss}}(\text{Al-O-Al})$ ,  $\nu_{\text{as}}(\text{Al-O-Al})$ ,  $\delta(\text{O-H})$ , and  $\mu_2(\text{O-H})$  red-shifted by 6, 17, 14, and 4  $\text{cm}^{-1}$  in [BMIM][BF<sub>4</sub>]/MIL-53(Al) and 4, 19, 7, and 6  $\text{cm}^{-1}$  in [BMIM][PF<sub>6</sub>]/MIL-53(Al), respectively. On the other hand, the position of  $\nu(\text{C-C})$ , which is in the organic linker part of the MOF, did not change within the spectral resolution of the measurements. These findings demonstrate that [BMIM][BF<sub>4</sub>] and [BMIM][PF<sub>6</sub>] interact with the aluminum backbone and bridging (O-H) group of the MIL-53(Al), while they do not

interact with the organic linker side. In the case of [BMIM][CF<sub>3</sub>SO<sub>3</sub>]/MIL-53(Al),  $\nu_{ss}(\text{SO}_3)$  and  $\nu_{as}(\text{SO}_3)$ , red-shifted by 5 and 6 cm<sup>-1</sup>, and  $\nu(\text{C}(4)\text{HC}(5)\text{H})$  and  $\nu(\text{C}(2)\text{-H})$  showed blue and red shifts of 4 and 14 cm<sup>-1</sup>, respectively. (Al-O-Al) vibrations,  $\nu(\text{C-C})$  and  $\delta(\text{C-C-C})$  did not show any significant shifts, while  $\mu_2(\text{O-H})$  vibration was slightly red-shifting by 3 cm<sup>-1</sup>. These findings might indicate that with a blue shift in  $\nu(\text{C}(2)\text{-H})$ , the C(2)-H bond shortens in length and hydrogen bonding between anion and cation gets weaker. Red shifts in (SO<sub>3</sub>) vibrations can be the result of IL-MOF interactions through (SO<sub>3</sub>) side of the anion, and consequently, the (CF<sub>3</sub>) side of the anion gets stronger as indicated by a blue shift in  $\nu_{as}(\text{CF}_3)$ . [BMIM][SbF<sub>6</sub>]/MIL-53(Al) and [BMIM][NTf<sub>2</sub>]/MIL-53(Al) reveal a similar behavior: their  $\nu(\text{C}(4)\text{HC}(5)\text{H})$ ,  $\mu_2(\text{O-H})$ ,  $\nu(\text{C-C})$ ,  $\delta(\text{C-C-C})$ , and  $\nu_{ss}(\text{Al-O-Al})$  remained the same within the spectral resolution of the measurements. The position of  $\nu(\text{C}(2)\text{-H})$  red-shifted from 3122 cm<sup>-1</sup> to 3114 cm<sup>-1</sup> in both composites. For the anion side of [BMIM][SbF<sub>6</sub>]/MIL-53(Al),  $\nu(\text{SbF}_6)$  slightly blue-shifted from 658 cm<sup>-1</sup> to 661 cm<sup>-1</sup>. Similarly, in the anion side of [BMIM][NTf<sub>2</sub>]/MIL-53(Al), the peaks positions for  $\nu_{as}(\text{S-N})$  and  $\nu_{as}(\text{CF}_3)$  do not change much.  $\nu(\text{C-S})$  blue-shifted by 11 cm<sup>-1</sup>, while  $\nu_{ss}(\text{S-N})$ ,  $\nu_{ss}(\text{SO}_2)$ , and  $\nu_{as}(\text{SO}_2)$  were red-shifting by 4, 3, and 7 cm<sup>-1</sup>, respectively. These results might indicate that anions of [BMIM][SbF<sub>6</sub>] and [BMIM][NTf<sub>2</sub>] interact with MIL-53(Al) and share their electrons with the MOF. This electron sharing causes a strengthening in (Sb-F) and (C-S) bond strengths as indicated by blue shifts in  $\nu(\text{SbF}_6)$  and  $\nu(\text{C-S})$ .

**Figure S5.** IR spectra of pristine MIL-53(Al) and IL/MIL-53(Al) composites in the region of (a) 4000-2000  $\text{cm}^{-1}$  and (b) 2000-400  $\text{cm}^{-1}$ , and of bulk ILs in the region of (c) 4000-2000  $\text{cm}^{-1}$  and (d) 2000-400  $\text{cm}^{-1}$ . Color code: red, pristine MIL-53(Al); black, [BMIM][BF<sub>4</sub>]; blue, [BMIM][PF<sub>6</sub>]; orange, [BMIM][CF<sub>3</sub>SO<sub>3</sub>]; violet, [BMIM][SbF<sub>6</sub>]; pink, [BMIM][NTf<sub>2</sub>].

**Figure S6.** IR spectra comparison of pristine MIL-53(Al), bulk ILs and IL/MIL-53(Al) composites between 4000-400  $\text{cm}^{-1}$ , where the IL is (a) [BMIM][BF<sub>4</sub>], (b) [BMIM][PF<sub>6</sub>], (c) [BMIM][CF<sub>3</sub>SO<sub>3</sub>], (d) [BMIM][SbF<sub>6</sub>], and (e) [BMIM][NTf<sub>2</sub>].

**Figure S7.** IR spectra showing  $\mu_2(\text{O-H})$  vibrations of pristine MIL-53(Al) and IL/MIL-53(Al) composites around  $3700\text{ cm}^{-1}$ . From bottom to top: pristine MIL-53(Al), [BMIM][BF<sub>4</sub>]/MIL-53(Al), [BMIM][PF<sub>6</sub>]/MIL-53(Al), [BMIM][CF<sub>3</sub>SO<sub>3</sub>]/MIL-53(Al), [BMIM][SbF<sub>6</sub>]/MIL-53(Al), and [BMIM][NTf<sub>2</sub>]/MIL-53(Al), respectively.

**Table S6.** Assignments for the vibrational IR bands of MIL-53(Al).

Vibrational Band Assignment	Position of the peak (cm <sup>-1</sup> )
$\mu_2(\text{O-H})$	3706

\*Dual-site Langmuir model is as follows,

$$n(P) = q_1 \times \frac{k_1 \times P}{1 + k_1 \times P} + q_2 \times \frac{k_2 \times P}{1 + k_2 \times P}$$

where  $P$  is the pressure of bulk gas at equilibrium with the adsorbed phase.  $q_1$  and  $q_2$  represent the saturation capacity on sites #1 and #2, while  $k_1$  and  $k_2$  are the affinity constants.

**Table S11.** Fitting parameters for virial-type thermal adsorption equation\* for CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub> isotherms measured at 10 and 20 °C for [BMIM][PF<sub>6</sub>]/MIL-53(Al) composite material.

\*Virial-type thermal adsorption equation:

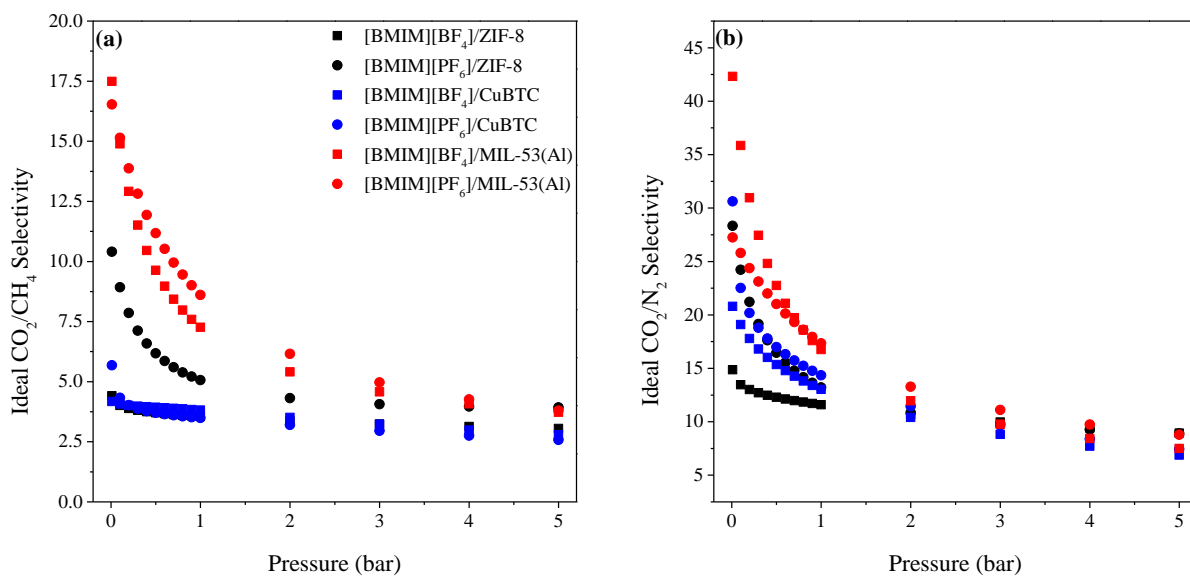

$$\ln P = \ln N + \frac{1}{T} \sum_{i=0}^5 a_i N^i + \sum_{i=0}^3 b_i N^i$$

where  $N$  is the gas uptake,  $P$  is the pressure of gas at equilibrium,  $T$  is the temperature and,  $a_i$  and  $b_i$  are the fitting parameters of the equation.

Isosteric heat of adsorption ( $Q_{st}$ ) is calculated using the equation below;

$$Q_{st} = -R \sum_{i=0}^5 a_i N^i$$

where  $N$  is the gas uptake,  $R$  is the gas constant, and  $a_i$  is fitting parameters obtained by fitting the virial-type thermal adsorption equation.

**Figure S10.** Ideal (a)  $\text{CO}_2/\text{CH}_4$  and (b)  $\text{CO}_2/\text{N}_2$  selectivities of  $[\text{BMIM}][\text{BF}_4]$ -incorporated and  $[\text{BMIM}][\text{PF}_6]$ -incorporated ZIF-8,<sup>[2,9]</sup> CuBTC,<sup>[1,8]</sup> and MIL-53(Al) composites as a function of pressure.
