Molecular Biology of the Cell

Liao et al.

Supplemental figure legends

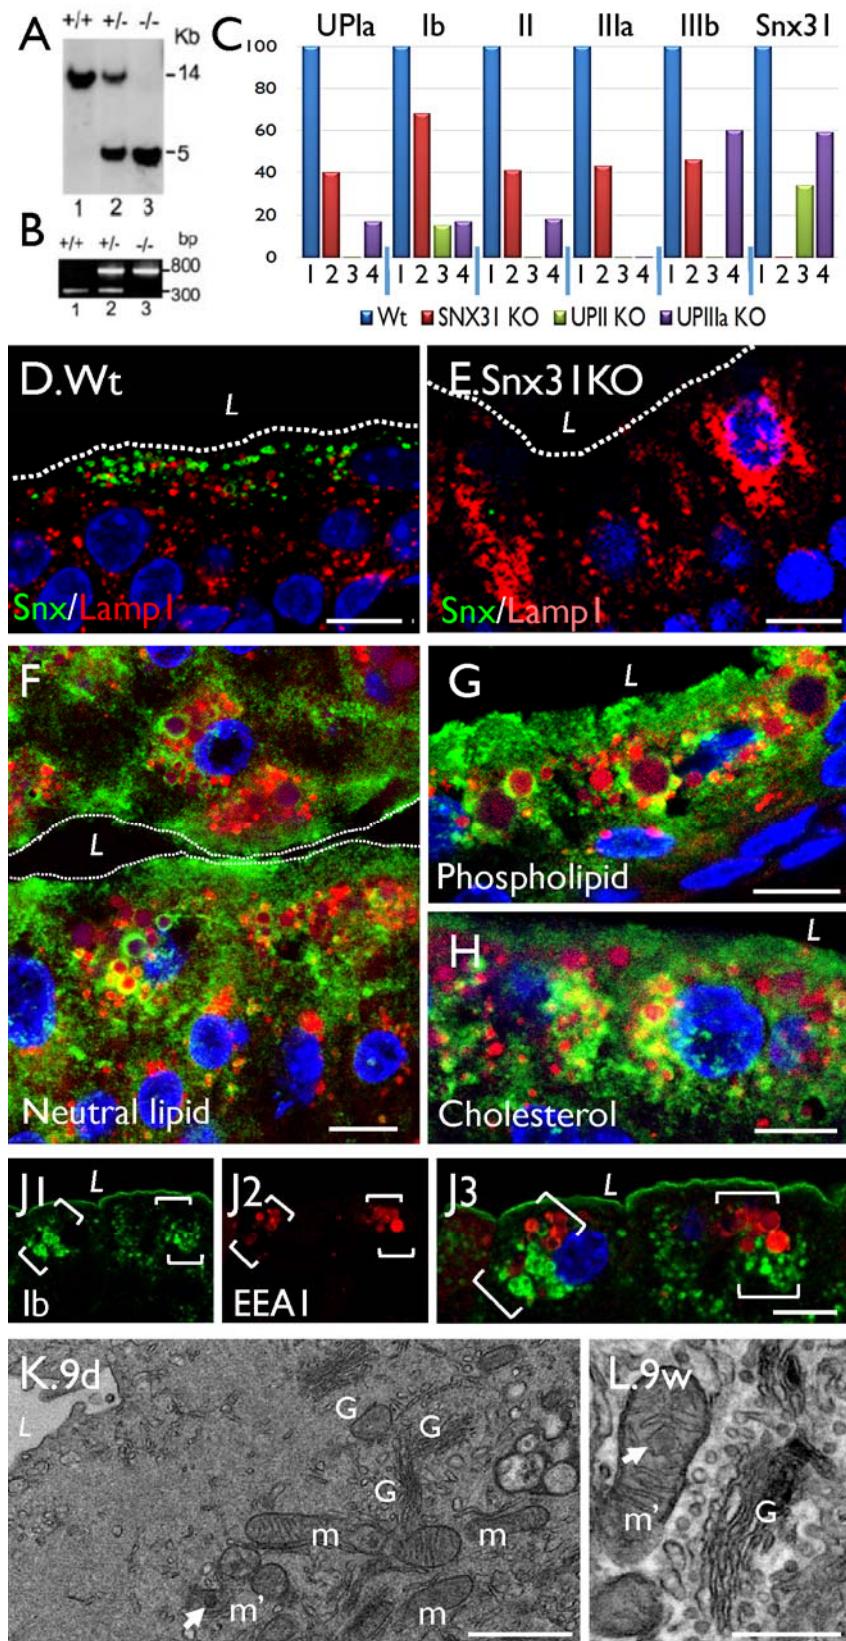

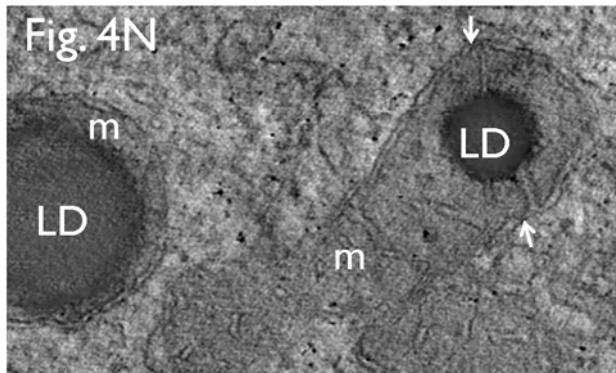

Figure S1. Generation of the *Snx31*-KO mice and LD accumulation (related to Fig. 1). (A) A 1070-bp fragment of the mouse *Snx31* gene (NM_025712), including Exon 3, which encodes part of the PX domain (39 amino acids out of 109), involved in binding phosphoinositides of vesicular membranes, was deleted using homologous recombination in embryonic stem cells (129SV background), resulting in a frame shift with a premature stop codon. (B) Southern blot showing the characterization of the +/+, +/-, and -/- mice. (C) Quantification of proteins shown in Fig. 8A. (D and E) Paraffin-sections of (D) wild type and (E) *Snx31*-KO mouse bladder were double-stained using antibodies to *Snx31* (green) and LAMP1 (red). Note in (D) the association of *Snx31* with the MVBs of wild type urothelium (Vieira et al., 2014), and in (E) the absence of *Snx31* (and the greatly increased LAMP1 staining) in the *Snx31*-KO (see text). (F-H) Frozen sections of the *Snx31*-KO mouse urothelium were double-stained for UPII (green) and (F) neutral lipid (HCS LipidTOX Green-NL), (G) Phospholipids (BODIPY HRC-PL), and (H) cholesterol (BODIPY Cholestryl). Dashed line and L indicate the apical urothelial surface and luminal space, respectively. (J) Paraffin-section of *Snx31*-KO mouse bladder was double-stained using antibodies to UPIb (green) and EEA1, an early endosome marker (red). Note the uroplakin Ib-positive LDs are EEA1-negative. (K, L) TEM images showing mitochondria (m) and proximal Golgi apparatus (G) in the urothelia of 9-day (G) and 9-week (H) old *Snx31* KO mice. Note in (K) the newly initiated intramitochondrial LD (arrow). Scale bars = 0.5- μ m in (L); 1- μ m in (K); 10- μ m in (D-J).

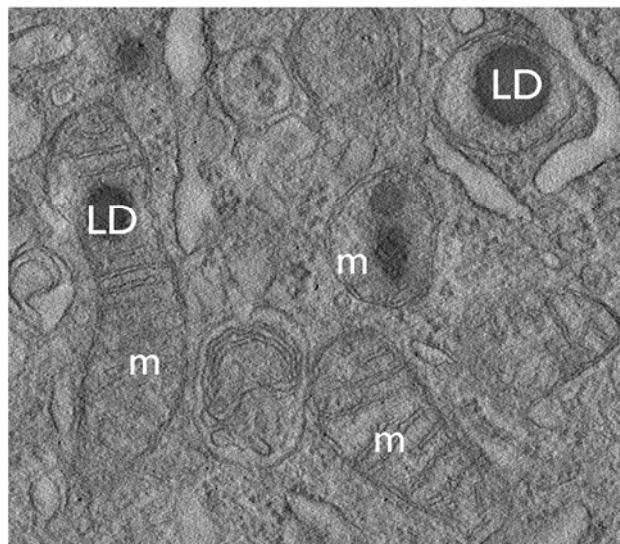

Supplemental video legends

Supplemental Video SV1 (related to Fig. 4N)

IA

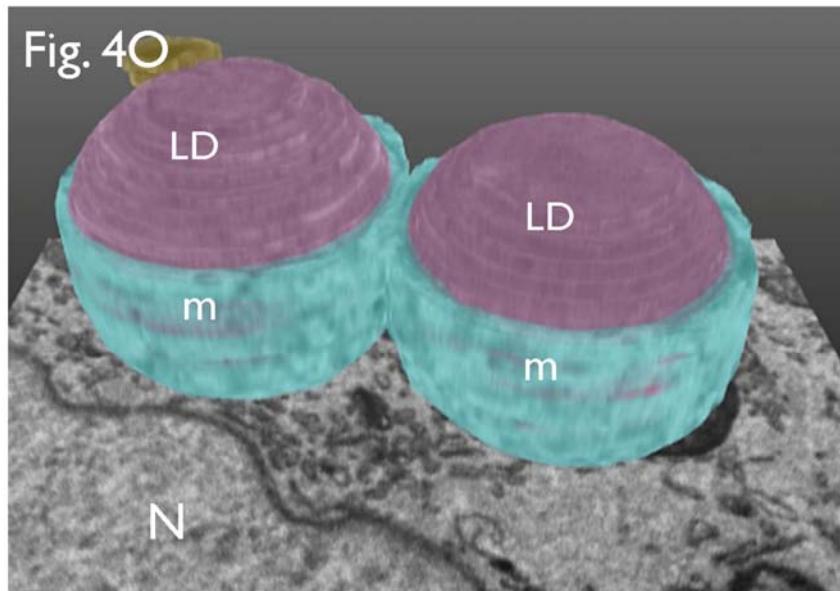

IB

Supplemental Video SV1A & B. Visualization of the intramitochondrial LDs by EM tomography (A is the basis for Fig. 4N). Serial images were collected from two different regions of an umbrella cells. Images were taken after the section was tilted every 2-degree from +70 to -70, and processed to generate a video. LD, m and arrows denote lipid droplet, mitochondria, and residual mitochondrial cristae, respectively. Note in (A) the intramitochondrial location of LDs (basis for Fig. 4N), and in (B) the relationship between the LDs and the mitochondrial cristae.

Supplemental Video SV2 (related to Fig. 4O)

Supplemental Video SV2. Visualization of intramitochondrial LDs by serial block-face SEM (basis for Fig. 4O). LD (purple), m (light blue) and N denote lipid droplet, mitochondria and nucleus, respectively. Note the intramitochondrial location of the LD.

Supplemental Table S1. Sources of reagents

Antibody / probe	Source	Catalog #	Host*	Dilution
active Caspase 3	Novus	NB100-56113	Rb	IF (10 µg/ml)
ADFP	Novus	NB110-40877	Rb	IF (10 µg/ml)
AIF	R&D	AF5824	Shp	IF (10 µg/ml)
Beclin1	Abcam	ab62472	Rb	IF (10 µg/ml)
BiP	Dr. Andrew Hu	N/A	Rb	IF (1:100)
Calnexin	Abcam	ab112995	Ms	IF (10 µg/ml)
Cox4	NOVUS	NB110-39115	Rb	IF (10 µg/ml)
EEA1	Bioss	bs-11250R	Rb	IF (10 µg/ml)
GM130	GeneTex	GTX61445	Rb	IF (10 µg/ml)
LAMP1	DSHB	1D4B-f	Rat	IF (1:100)
LC3	Cell Signaling	12741	Rb	IF (10 µg/ml)
PDI	Dr. Andrew Hu	N/A	Rb	IF (1:100)
