

Supplementary Material

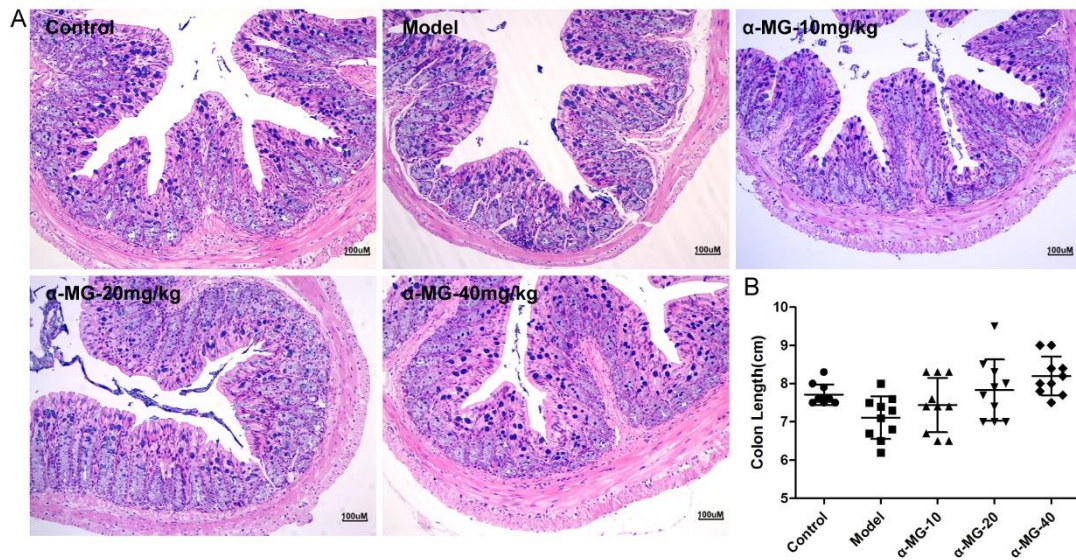

Fig. S1 Evaluate the effects of α -MG at the dose of 10 mg/kg on colonic lesions. One week after BLM treatment (5 mg/kg), mice were orally administered with α -MG (10, 20, 40 mg/kg) once a day for 14 days. Mouse lungs were collected on day 21 after BLM treatment. The representative H&E-stained colon sections (magnification $\times 100$) (A) and colon length (B) from each group of mice were shown. Data were expressed as the mean \pm S.D. (n = 10). NS, non-significant.
