### Supplementary Figure 1. CreER-mediated inducible knock-out of Tti2 (tti2-CKO strains).

**a** Illustration of the *tti2<sup>+</sup>* locus engineered with loxP sites (L black triangles) flanking the entire gene, before and after β-estradiol-induced Cre recombinase activity.

**b** Estimation of *lox-tti2-lox* locus recombination efficiency. Ten-fold serial dilutions of *tti2*-CKO cultures treated with either DMSO or β-estradiol for 18 hours were spotted on rich medium and incubated for 3 days at 32°C.

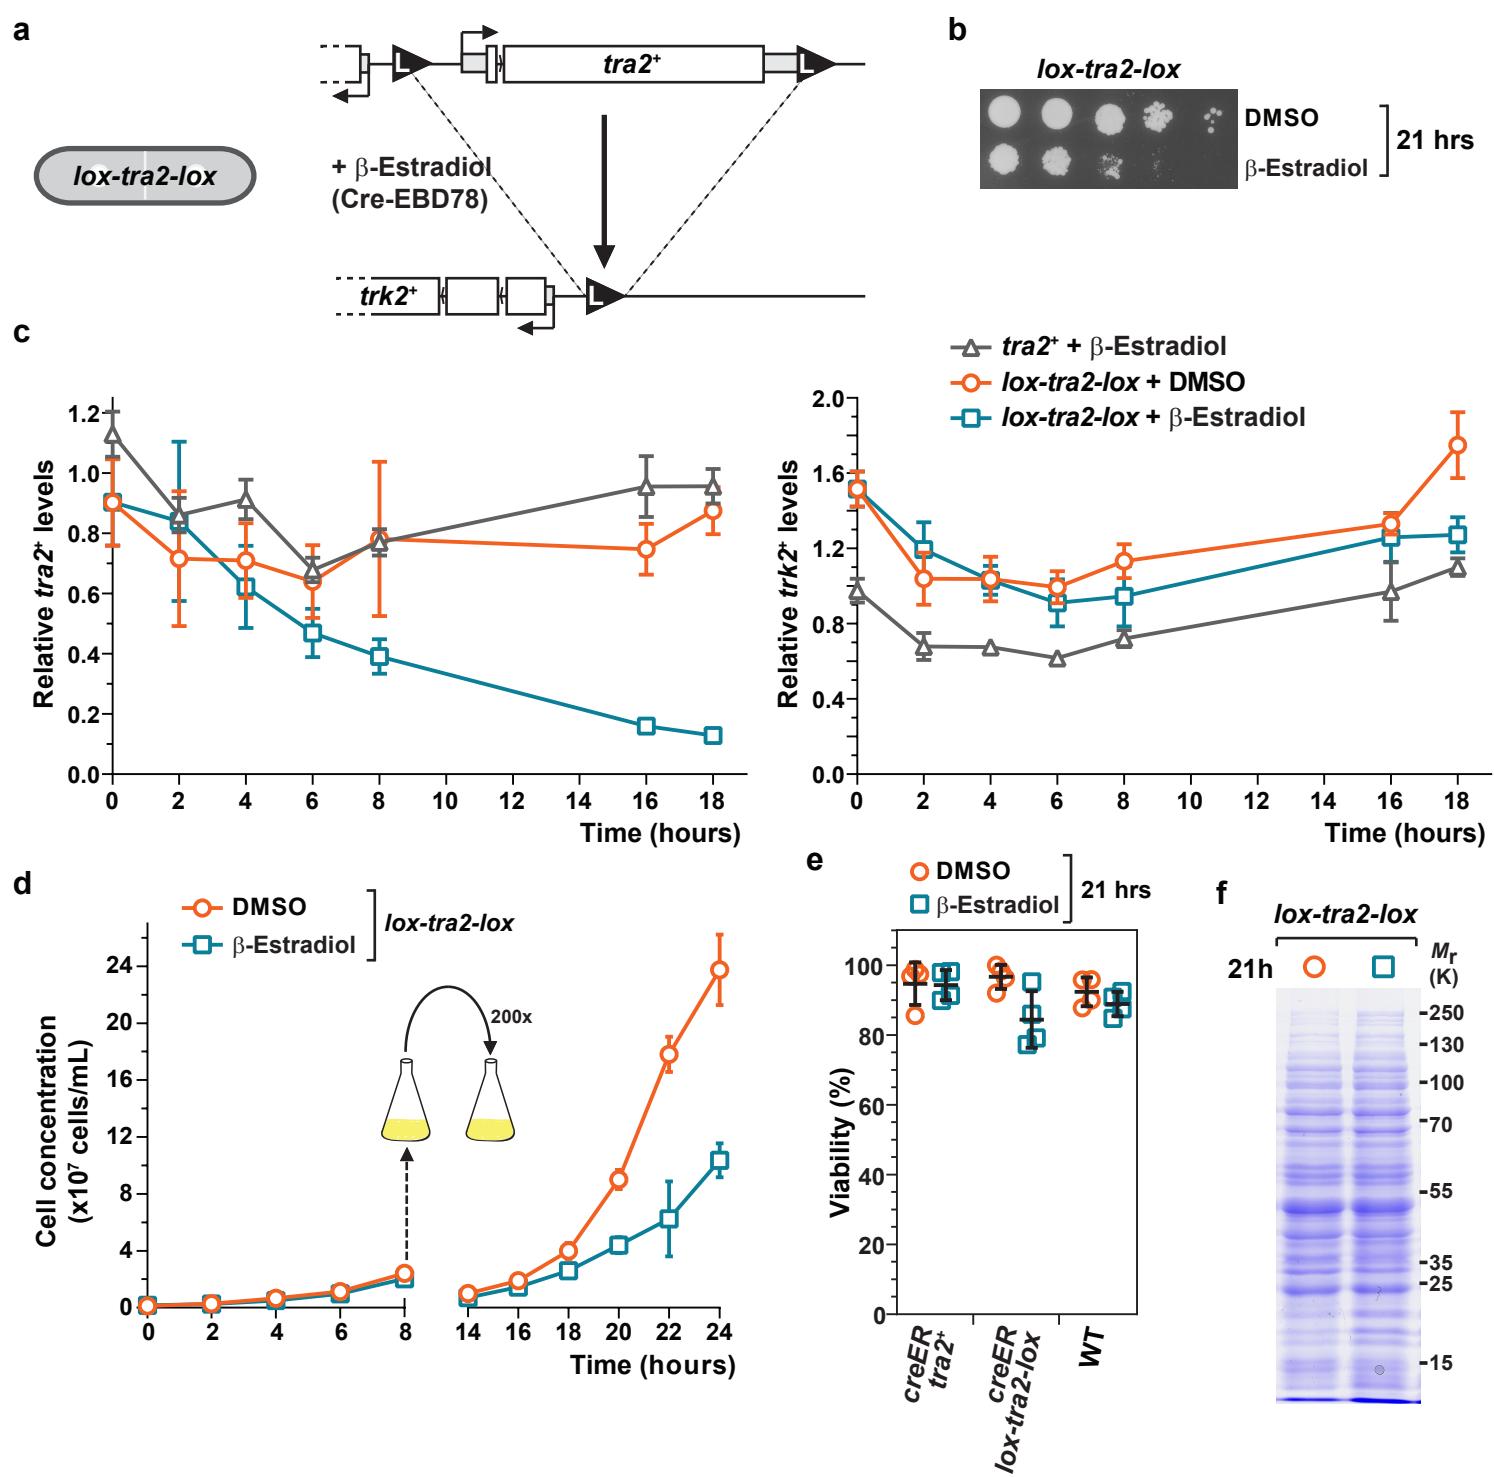

**c** Anti-HA Western blot analysis of Tti2-HA expression at different time points upon *tti2<sup>+</sup>* knock-out, as compared to a non-loxed *tti2-HA* strain. Ponceau red staining is used as a loading control. Shown below is a quantification of Tti2-HA signal intensity from linear chemiluminescence exposures, normalized to Ponceau red signals, and averaged from two independent experiments (n = 2).

**d** Proliferation defects of *tti2*-CKO strains estimated from growth curves of liquid cultures diluted such as to count cells during exponential growth, at different time points, in DMSO- and β-estradiol-containing media (orange circles and blue squares, respectively). Each value represents the average number of cells from four independent replicates with the SD (n = 4). At least 50 cells from the indicated genotypes were counted at each time point.

**e** Viability of *tti2*-CKO strains grown in liquid media and treated with either DMSO (orange circles) or β-estradiol (blue squares) for 18 hours. The percentage of viable cells was estimated from methylene blue staining of liquid cultures and counting at least 200 cells by light microscopy. Four independent experiments are shown as individual points, overlaid with the mean and SD (n = 4).

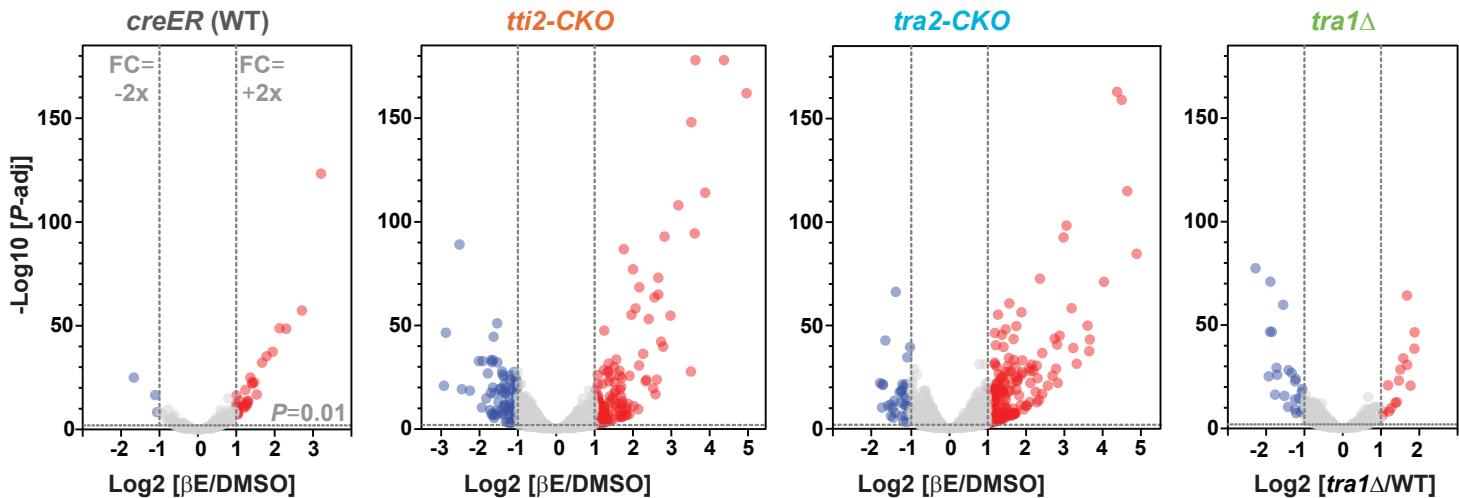

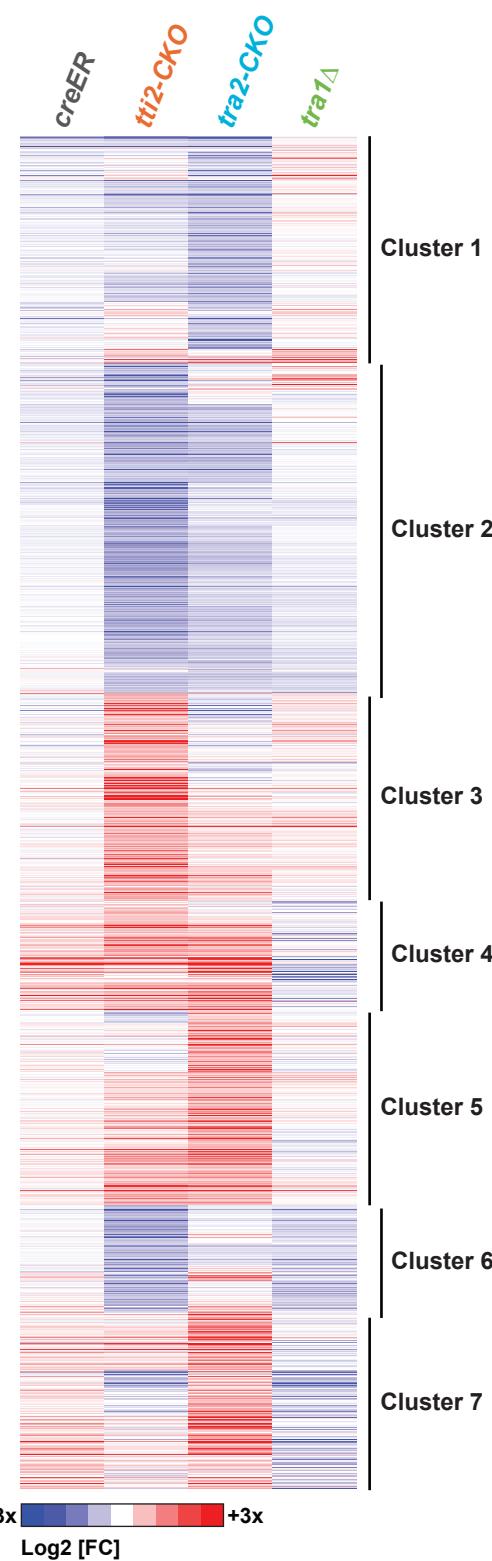

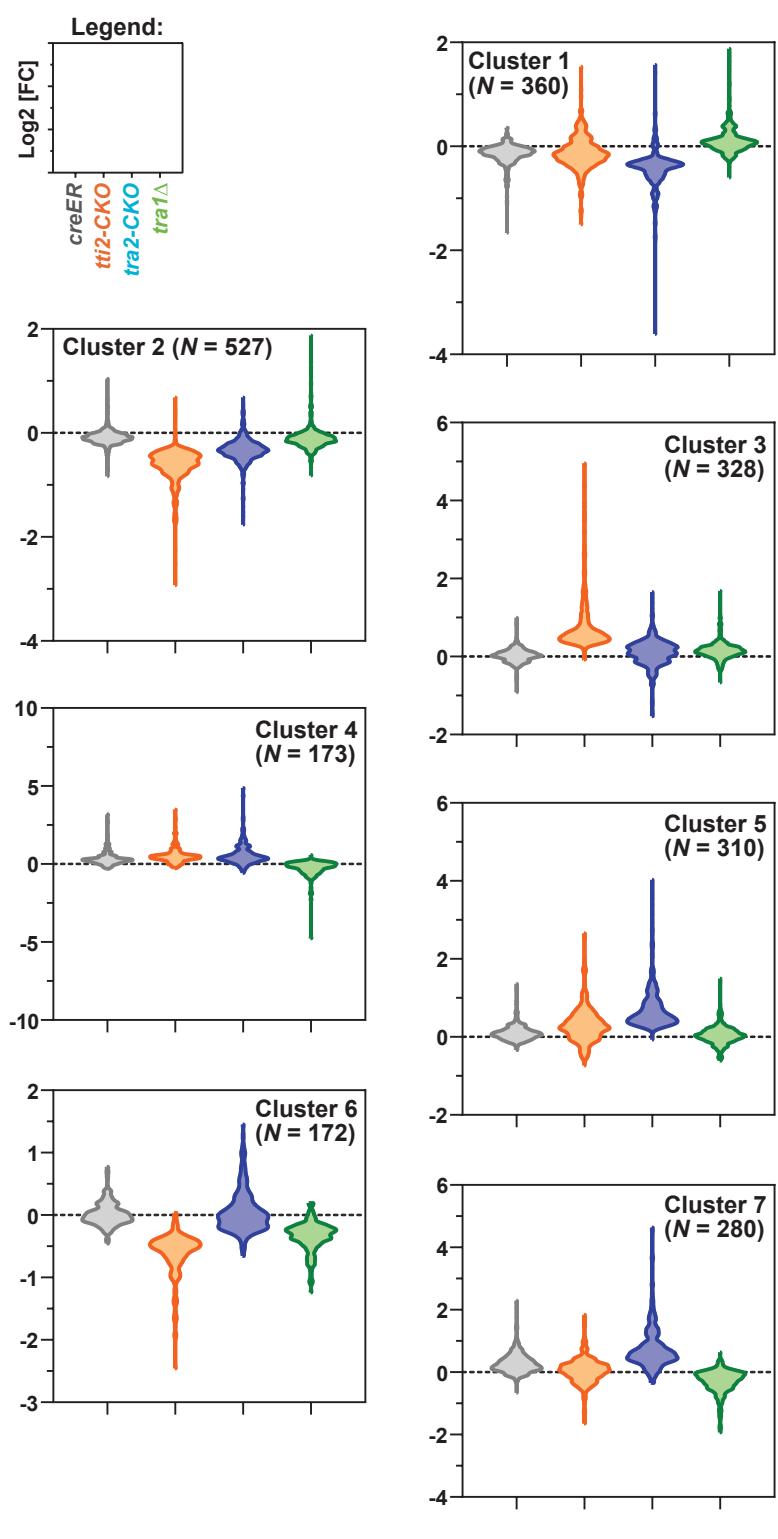

**f** Coomassie blue staining of total protein extracts from *tti2*-CKO strains grown as in (e).

Source data are provided as a Source Data file.

**Supplementary Figure 2. CreER-mediated inducible knock-out of Tra2 (tra2-CKO strains).**

- a** Illustration of the *tra2*<sup>+</sup> locus engineered with loxP sites (L black triangles) flanking the entire gene, before and after β-estradiol-induced Cre recombinase activity.
- b** Estimation of *lox-tra2-lox* locus recombination efficiency. Ten-fold serial dilutions of *tra2*-CKO cultures treated with either DMSO or β-estradiol for 21 hours were spotted on rich medium and incubated for 3 days at 32°C.
- c** RT-qPCR analysis of the expression of *tra2*<sup>+</sup> (left) and of its divergently transcribed 5' neighbouring gene, *trk2*<sup>+</sup> (right), at different time points upon *tra2*<sup>+</sup> knock-out. A wild-type control strain grown in β-estradiol (grey triangles) and a *tra2*-CKO strain grown either in DMSO (orange circles) or in β-estradiol (blue squares) were analyzed. Each value represents mean mRNA levels from four independent RT-qPCR experiments with the SD ( $n = 4$ ). *act1*<sup>+</sup> served as a control for normalization across samples. Values from one control experiment were set to 1 to allow comparisons across culture conditions and mutant strains.
- d** Proliferation defects of *tra2*-CKO strains estimated from growth curves of liquid cultures diluted such as to count cells during exponential growth, at different time points, in DMSO- and β-estradiol-containing media (orange circles and blue squares, respectively). Each value represents the average number of cells from four independent replicates with the SD ( $n = 4$ ). At least 50 cells from the indicated genotypes were counted at each time point.
- e** Viability of *tra2*-CKO strains grown in liquid media and treated with either DMSO (orange circles) or β-estradiol (blue squares) for 21 hours. The percentage of viable cells was estimated from methylene blue staining of liquid cultures and counting at least 200 cells by light microscopy. Four independent experiments are shown as individual points, overlaid with the mean and SD ( $n = 4$ ).
- f** Coomassie blue staining of total protein extracts from *tra2*-CKO strains grown as in (e). Source data are provided as a Source Data file.

Supplementary Figure 3. Transcriptome analyses of *tti2-CKO*, *tra2-CKO* and *tra1 $\Delta$*  mutants. (See next page)

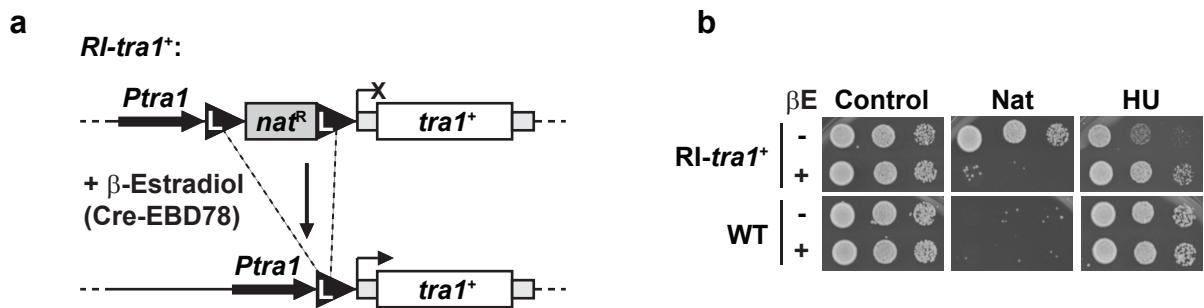

### **Supplementary Figure 3. Transcriptome analyses of *tti2*-CKO, *tra2*-CKO and *tra1* $\Delta$ mutants.**

**a** Volcano plots of RNA-seq data comparing the fold change of normalized counts versus the adjusted *P* value, calculated using the DESeq2 package. RNA-seq were performed in triplicate from control *creER* (WT), inducible *tti2*+ knock-out (*tti2*-CKO), inducible *tra2*+ knock-out (*tra2*-CKO), and *tra1* $\Delta$  mutants. Differential gene expression analysis was performed by comparing cells treated with DMSO and  $\beta$ -estradiol ( $\beta$ E), for either 21 hours (*creER* and *tra2*-CKO strains) or 18 hours (*tti2*-CKO strain). *tra1* $\Delta$  mutants were compared to isogenic wild-type (WT) control cells. Up- and down-regulated genes with a fold change  $\geq 2$  and a *P* value  $\leq 0.01$  are coloured in red and blue, respectively, and these thresholds are shown as grey dashed lines.

**b** Heatmap of differentially expressed genes ordered by clusters from RNA-seq data of control *creER* (WT), inducible *tti2*+ (*tti2*-CKO) and *tra2*+ knock-outs (*tra2*-CKO), and *tra1* $\Delta$  mutants (columns). Differential gene expression analysis was performed as in (a). Rows represent genes that are differentially expressed in at least one condition (*P*  $\leq 0.01$ ), with their fold change (Log2 [FC]) colour-coded as indicated in the scale bar. Hierarchical clustering of genes was performed in Cluster 3.0, using the complete linkage method and based on Pearson correlation distance measures, and revealed seven major clusters.

**c** Violin plots showing the distribution of gene expression changes within each of the seven clusters identified in (b). In each graph, Log2 fold changes are shown (Log2 [FC]) in control strains (*creER*, grey), upon depletion of Tti2 (*tti2*-CKO, orange), of Tra2 (*tra2*-CKO, blue), and upon Tra1 deletion (*tra1* $\Delta$ , green).

Source data are provided as a Source Data file.

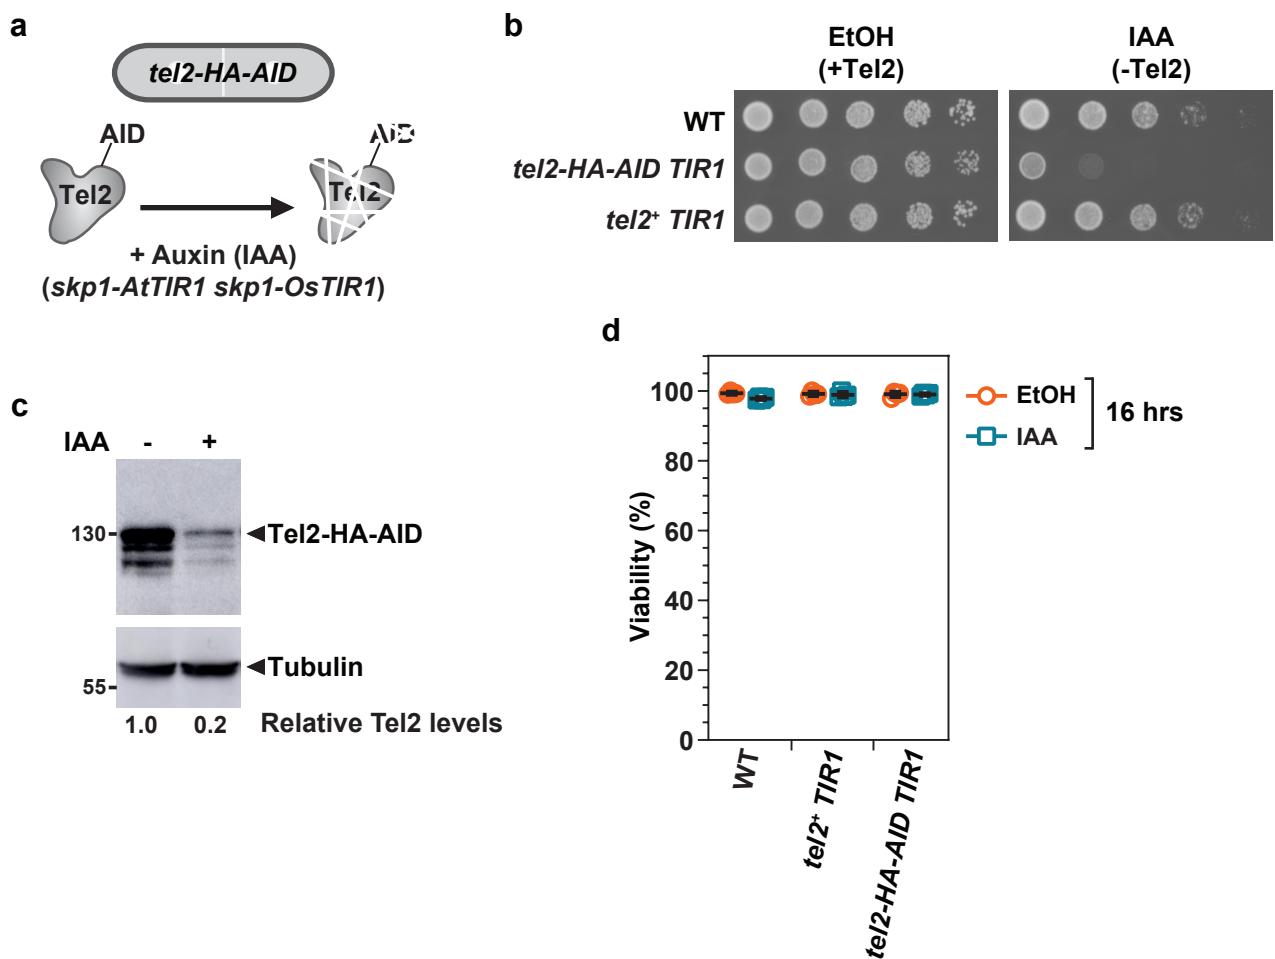

**Supplementary Figure 4. Genetic assay to follow the fate of Tra1 upon *de novo* synthesis.**

**a** Illustration of the strategy to follow the fate of newly synthesized Tra1 (Recombination Induced-*tra1<sup>+</sup>*). A strong transcription terminator sequence from the *Ashbya gossypii* *TEF1* gene, included in the antibiotic resistance cassette, flanked by two *loxP* sites (L black triangles) was inserted between *tra1<sup>+</sup>* promoter and ORF. Addition of β-estradiol allows recombination-induced *de novo* expression of Tra1 at endogenous levels.

**b** Growth phenotype of control WT and *RI-tra1<sup>+</sup>* strains, grown in liquid media and treated with either DMSO (-) or β-estradiol (+). Ten-fold serial dilutions were spotted on rich medium (control), supplemented with Nourseothricin (Nat) or 10 mM hydroxyurea (HU), and incubated for 3 days at 32°C.

Source data are provided as a Source Data file.

**Supplementary Figure 5. Auxin-mediated inducible depletion of Tel2.**

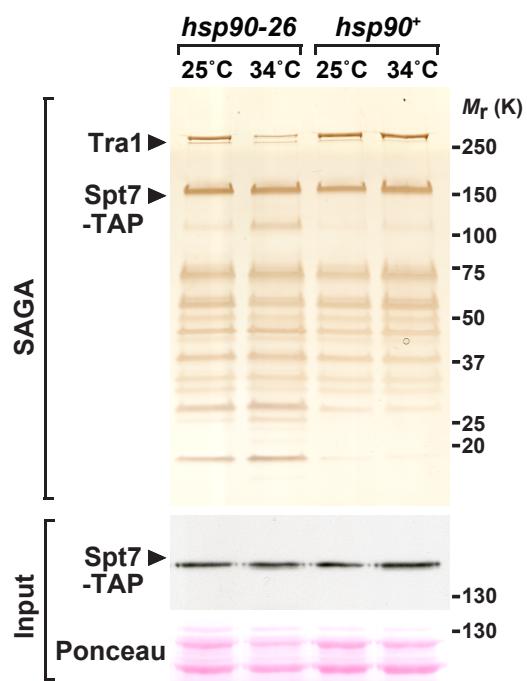

**a** Illustration of the auxin-inducible degron (AID) system for endogenous Tel2 depletion, using strains in which *S. pombe* Skp1 is fused to *Arabidopsis thaliana* Tir1 and *Oryza sativa* Tir1. Addition of the plant hormone auxin to the media (IAA; indolacetic acid) allows the rapid and conditional degradation of Tel2.

**b** Growth phenotype cells depleted for Tel2. *tel2-HA-AID skp1-AtTIR1 skp1-OsTIR1* strains were grown to exponential phase in minimal medium supplemented with either ethanol (EtOH; +Tel2) or auxin (IAA; -Tel2). Ten-fold serial dilutions were then spotted on corresponding solid media and grown for 4 days at 25°C. WT and *skp1-AtTIR1 skp1-OsTIR1* strains were used as controls.

**c** Anti-HA Western blot analysis of Tel2-HA-AID expression 16 hours after adding auxin. An anti-tubulin antibody served as loading control. Shown below is a quantification of Tel2-HA signal intensity from linear chemiluminescence exposures, normalized to Tubulin signals, and averaged from two independent experiments ( $n= 2$ ).

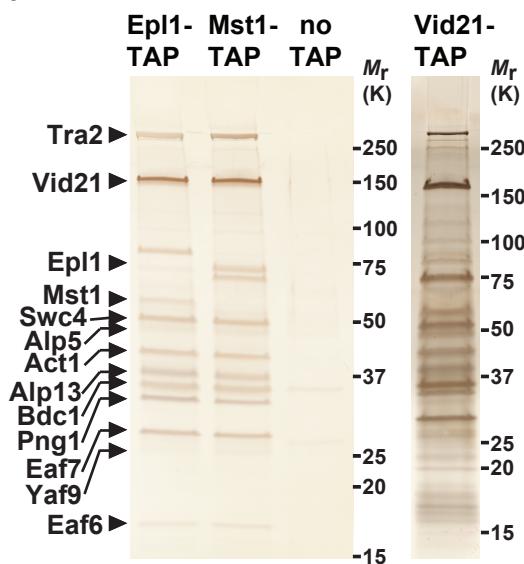

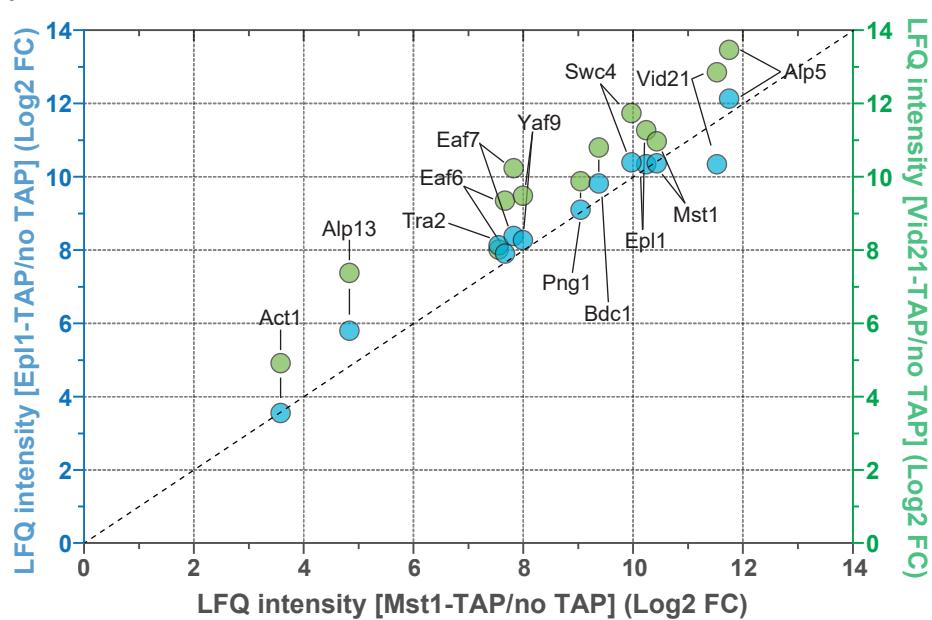

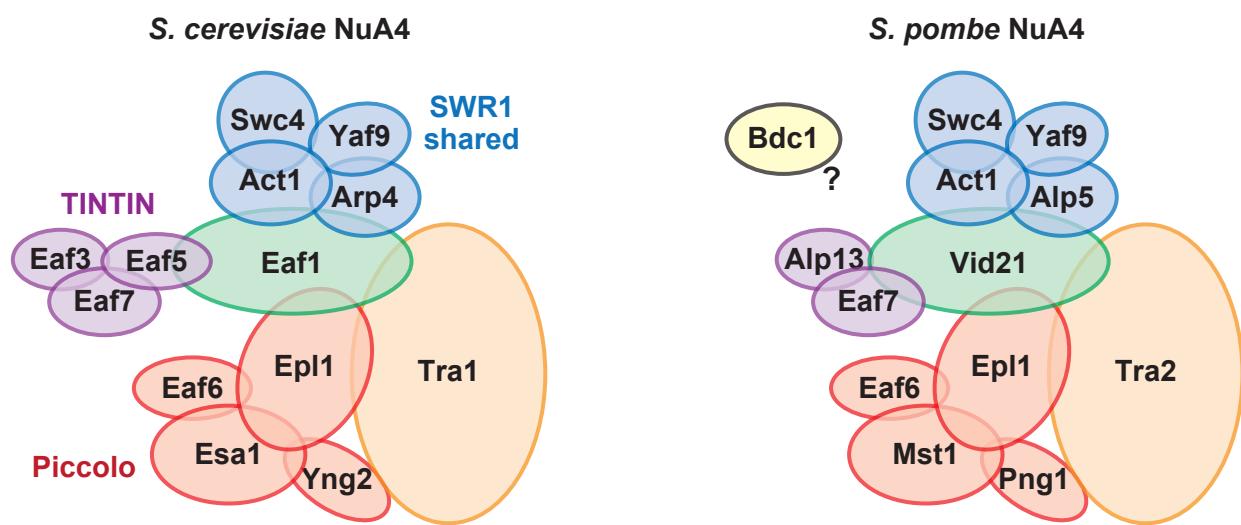

**d** Percentage of viable cells estimated from methylene blue staining of liquid cultures and counting at least 200 cells by light microscopy. Four independent experiments are shown as individual points, overlaid with the mean and SD ( $n = 4$ ).

Source data are provided as a Source Data file.

**Supplementary Figure 6. Hsp90 promotes Tra1 incorporation into the SAGA complex.**

Silver staining analysis of SAGA complexes purified from WT and *hsp90-26* mutants, using Spt7 as the bait. Cells were grown to exponential phase at the permissive temperature (25°C) and shifted for 6 hours at the restrictive temperature (34°C). Below is an anti-HA Western blot of Spt7-TAP from a fraction of the input used for TAP. Ponceau red staining is used as loading control. Shown are data that are representative of two independent experiments. Source data are provided as a Source Data file.

**a****b****c**

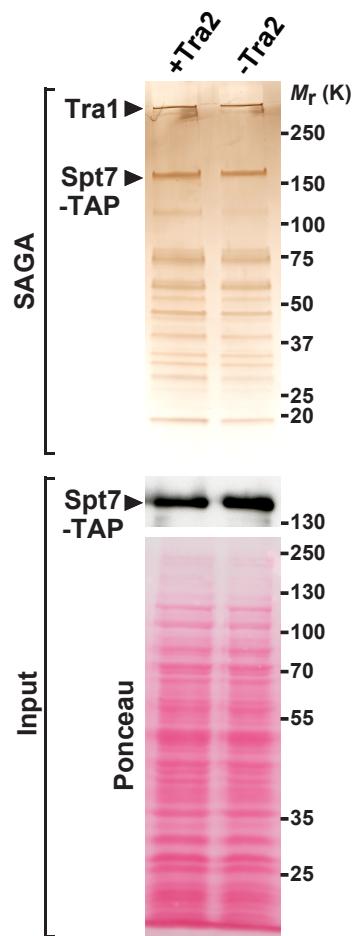

**Supplementary Figure 7. Characterization of the *S. pombe* NuA4 complex.**

**a** Silver staining analysis of NuA4 complexes purified using Mst1, Epl1, or Vid21 as baits. A non-tagged strain (no TAP) was used as a control for background. The position of each NuA4 subunit is annotated on the gel according to their predicted molecular weight.

**b** Tandem mass spectrometry analyses (LC-MS/MS) of tandem affinity purified Mst1, Epl1, and Vid21 from (a). Each individual point represents the LFQ intensity ratio of a protein in TAP eluates relative to a 'no TAP' control. For Epl1-TAP and Vid21-TAP, each value represents an average from two independent replicates ( $n = 2$ ). Blue compares Epl1 with Mst1 eluates, whereas green compares Vid21 with Mst1 eluates. The black dashed line represents a 1:1 ratio.

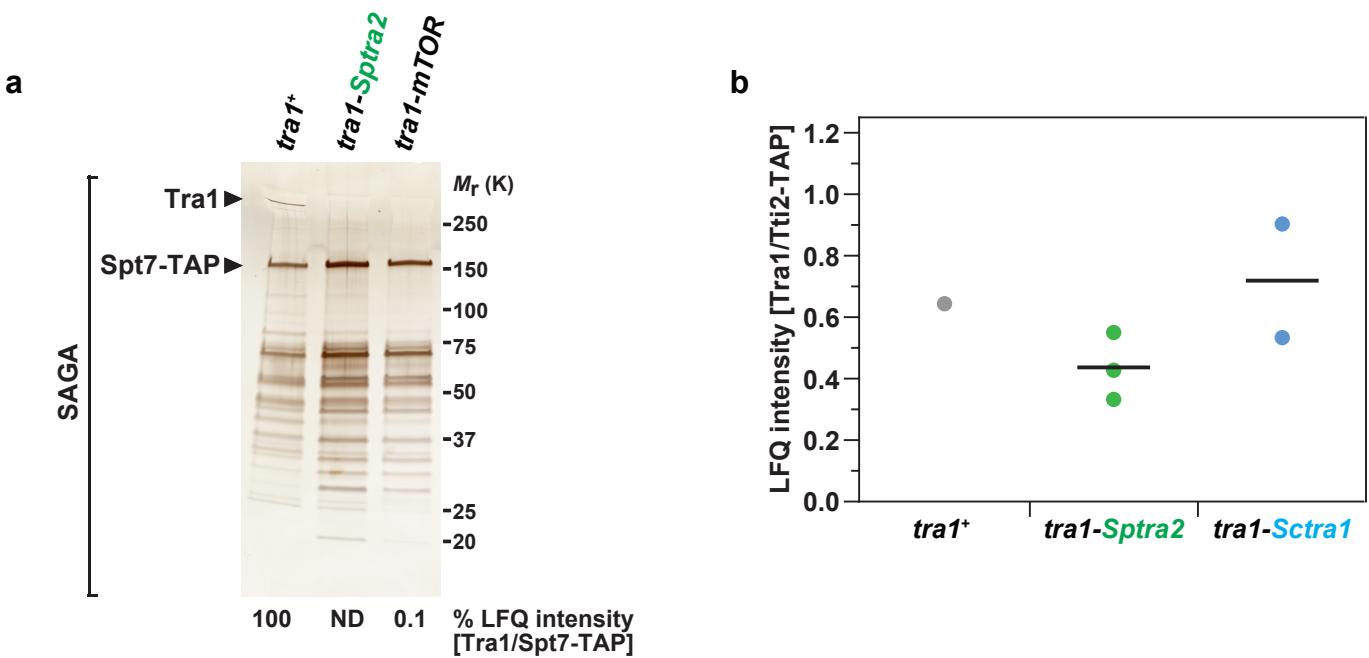

**c** Comparison of NuA4 complex subunit composition between *S. cerevisiae* and *S. pombe*.

Source data are provided as a Source Data file.

**Supplementary Figure 8. Control SAGA purifications upon conditional depletion of Tra2.**

Silver staining of SAGA complexes purified either in presence or absence of Tra2, using Spt7-TAP as the bait. *spt7-TAP tra2-CKO* cells were grown to exponential phase in rich medium supplemented with either DMSO (+Tra2) or β-estradiol (-Tra2) for 21 hours. Below is an anti-HA Western blot of Spt7-TAP from a fraction of the input used for TAP. Ponceau red staining is used as loading control. Shown are data that are representative of two independent experiments. Source data are provided as a Source Data file.

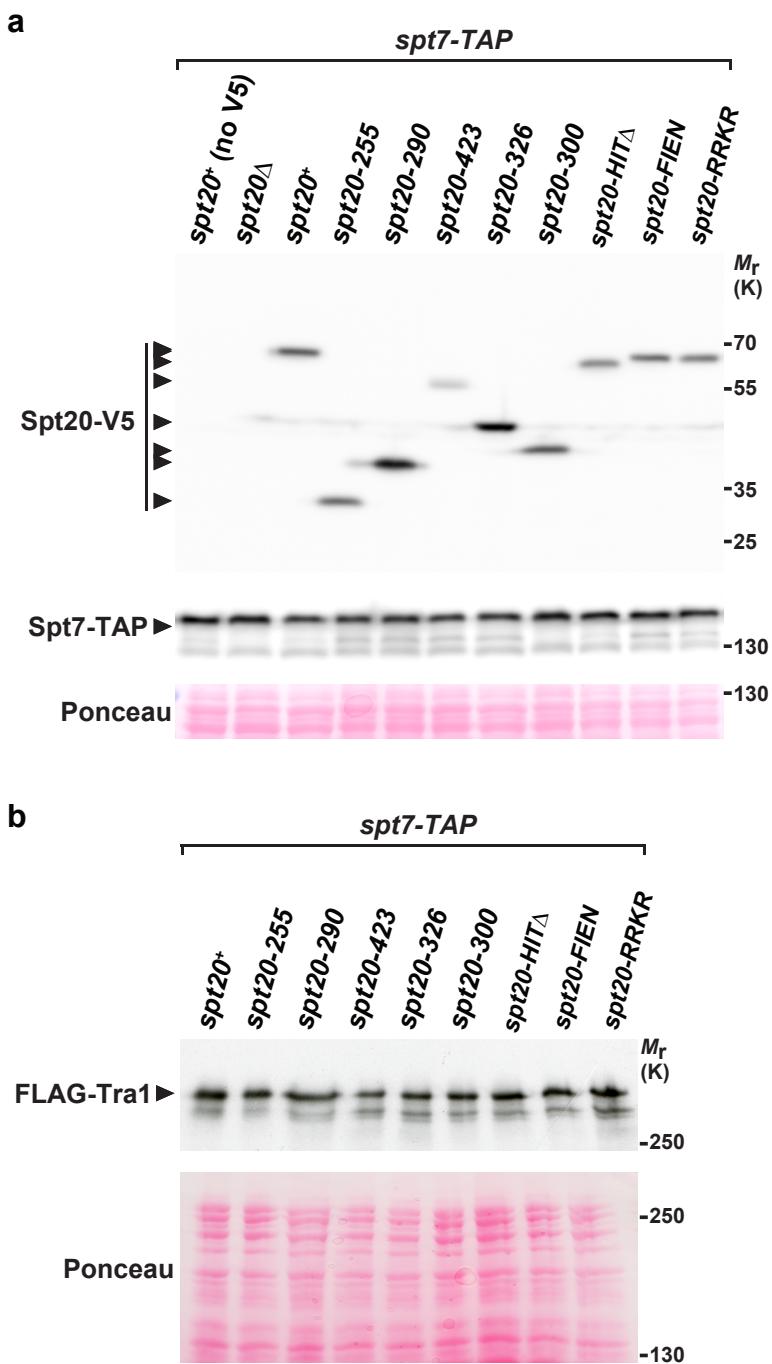

**Supplementary Figure 9. The CSI region of Tra1 is not required for its interaction with TTT.**

**a** Residues 2623-2676 from *S. pombe* Tra1 were swapped with the homologous region from either *S. pombe* Tra2 (residues 2564-2617, green), to create the *tra1-Sptra2* allele, or *Homo sapiens* mTOR (residues 1456-1504), to create the *tra1-mTOR* allele. Silver staining analysis of SAGA complexes purified from WT, *tra1-Sptra2*, and *tra1-mTOR* strains, using Spt7 as the bait. Numbers at the bottom of the gel represent LFQ intensity ratios of Tra1 to Spt7, from LC-MS/MS analyses of purified SAGA complexes. Values for each mutant are expressed as percentage of WT SAGA (ND: not detected). Shown are gels that are representative of two independent experiments.

**b** LC-MS/MS analysis of TTT complexes purified from WT, *tra1-Sptra2*, and *tra1-Sctra1* strains (see Fig. 5b), using Tti2 as the bait. LFQ intensity ratios of Tra1 to Tti2 from 1-3 biological replicates are plotted individually with the mean (black bar).

Source data are provided as a Source Data file.

**Supplementary Figure 10. Expression levels of Tra1, Spt7, and Spt20 in truncation and point mutants.**

**a** Anti-V5 and anti-HA Western blot analyses of Spt20-V5 (upper blot) and Spt7-TAP (lower blot) in a fraction of the input used for TAPs shown in Figure 5. Ponceau red staining is used as loading control.

**b** Anti-FLAG Western blot analyses of FLAG-Tra1 in total extracts from all *spt20* mutants analyzed in Figure 5. Ponceau red staining is used as loading control.

Source data are provided as a Source Data file.

**Supplementary Table 1. Quantification of SAGA subunit levels in Spt7 affinity purifications from *spt20* mutants. Shown are LFQ intensities from LC-MS/MS analyses of total protein mixtures from purification eluates in two distinct experiments, analyzing either a wild-type and an *spt20-255* N-terminal truncation mutant, or a wild-type and an *spt20*Δ deletion mutant.**

**Supplementary Table 2. Quantification of Tra1, Sgf73, and Ubp8 levels in Spt7 affinity purifications from *spt20* and *tra1* mutants.**  
 Shown are relative LFQ intensity ratios of each subunit, normalized to the bait, Spt7, from LC-MS/MS analyses of total protein mixtures from purification eluates. Spt7 was purified from wild-type (WT), spt20-290, spt20-300, spt20-HITΔ, spt20-FIEN, spt20-RRKR, tra1-Sptra2, and tra1-Sctra1 strains. Values from the WT sample were set at to 1, allowing to allow comparisons across mutants.

	LFQ ratio [WT]	LFQ ratio [spt20-290 ]	LFQ ratio [spt20-300 ]	LFQ ratio [spt20-HIT Δ]	LFQ ratio [spt20-FIEN ]	LFQ ratio [spt20-RRKR ]
