Values in KI-NT, KI-S282 and KI-D282 are given in fold-change over WT. nd: not-determined.

Suppl. Fig. 1 Immunofluorescence images of KI EHTs transduced with AAV6 encoding wild-type cMyBP-C (S282) or phosphomimetic cMyBP-C (D282) KI EHTs were transduced at MOI of 1,000 vg/cell. After fixation EHTs were co-stained with antibodies directed against the FLAG-tag for exogenous cMyBP-C (green) and total cMyBP-C (red). Nuclei were stained with DRAQ5 (blue). Scale bars 20 μ m. Higher magnifications (zoom-in) images are shown on the right side. Scale bars 5 μ m.

Suppl. Fig. 2 Contraction velocity (CV) and relaxation velocity (RV) measured on the day of highest force development [a]-[b] Contraction and relaxation velocities under spontaneous contraction. Numbers of EHTs/batches: WT 51/5; KI-NT 61/7; KI-S282 26/5; KI-D282 20/5. [c]-[d] Contraction and relaxation velocities calculated under electrical stimulation. WT n = 15; KI-NT n = 8; KI-S282 n = 6; KI-D282 n = 7. Data are expressed as mean \pm SEM. **P<0.01 vs. WT, one-way ANOVA plus Dunnett's multiple comparisons test.

Suppl. Fig. 3 Effect of isoprenaline on relaxation time ($T_{20\%}$) under electrical stimulation. EHTs of all groups were treated 15 min with 100 nM isoprenaline at submaximal external $[Ca^{2+}]$ in Tyrode's solution and paced at 6 Hz. $T_{20\%}$ was decreased in WT, S282 (* $P < 0.05$ Student's t-test) and D282 EHTs.
