

Supplementary Figure 1 Electrophoresis pattern of the RT-PCR products (RT+) and the negative control missing reverse transcription (RT-) from transcripts of HEK293T cells transfected with a mutated (del) and a wild-type (WT) minigene plasmid bearing exons 8 to 9 of PISD, as well as from untransfected HEK293T cells (HEK). No endogenous transcript appears to be amplified from untransfected cells.
