

Supplemental Figure 1. Effect of anti-CD25 mAb treatment on cell-associated viral burden. FIV proviral load in peripheral blood mononuclear cells (PBMC)(A.) and lymph node (LN) cells (B.) on days -10, 0 and 3 post-Lm infection. Chronically FIV-infected cats were treated with either control mAb (circles) or anti-CD25 mAb (diamonds). Statistical analysis was performed using 1-way ANOVA with Tukey's post-test. N=6 for each treatment group.
