Figure EV1. Identification and expression levels of *circ-CUX1*.

- A Flowchart delineating the discovery of *circ-CUX1* from tumor tissues and cell lines. FAM, normal fetal adrenal medulla.
- B RT-PCR assay with divergent primers showing the detectable circRNAs of correct size (asterisks) in IMR32 cells.
- C Real-time qRT-PCR assay indicating the circRNA levels in FAM ($n = 13$) and NB tissues ($n = 20$). Student's *t*-test, $*P < 0.05$ versus FAM.
- D Dual-luciferase assay showing transactivation activity of CUX1 in IMR32 and SH-SY5Y cells transfected as indicated ($n = 5$). Student's *t*-test, one-way ANOVA, $*P < 0.05$ versus empty vector (mock) or scramble shRNA (sh-Scb).
- E Real-time qRT-PCR assay indicating *circ-CUX1* levels (normalized to β -actin) in NB tissues ($n = 54$). Bars are means and whiskers show min to max. Student's *t*-test.
- F Kaplan–Meier curve showing overall survival of 54 NB patients with low or high *circ-CUX1* levels (cutoff value = 10.77). Log-rank test.
- Data information: Data are presented as mean \pm SEM. Exact *P* values are specified in Appendix Table S4.

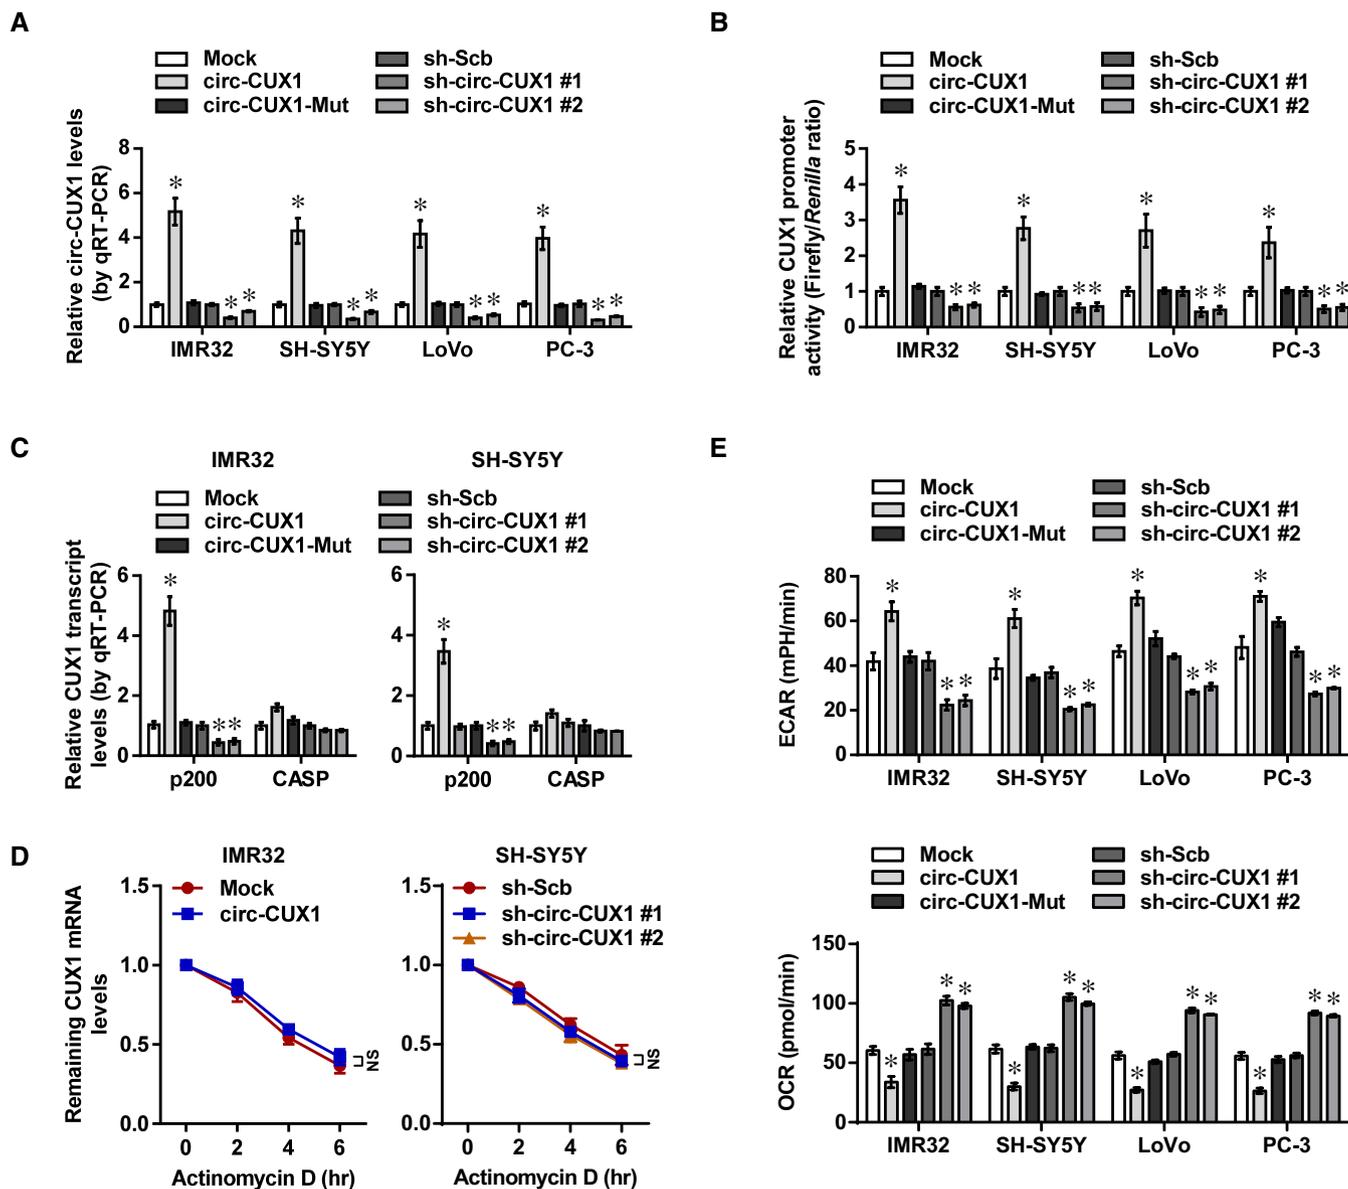

Figure EV2. *Circ-CUX1* facilitates *CUX1* transcription and aerobic glycolysis of tumor cells.

- A Real-time qRT-PCR assay indicating expression of *circ-CUX1* (normalized to β -actin) in IMR32, SH-SY5Y, LoVo, or PC-3 cells stably transfected as indicated ($n = 5$). One-way ANOVA, $*P < 0.05$ versus empty vector (mock) or scramble shRNA (sh-Scb).
- B Dual-luciferase assay showing the activity of *CUX1* promoter in IMR32, SH-SY5Y, LoVo, or PC-3 cells stably transfected as indicated ($n = 5$). One-way ANOVA, $*P < 0.05$ versus mock or sh-Scb.
- C Real-time qRT-PCR assay indicating expression of *CUX1* isoforms (normalized to β -actin) in IMR32 and SH-SY5Y cells stably transfected as indicated ($n = 5$). One-way ANOVA, $*P < 0.05$ versus empty vector (mock) or scramble shRNA (sh-Scb).
- D Real-time qRT-PCR assay indicating *CUX1* mRNA levels in IMR32 and SH-SY5Y cells stably transfected as indicated ($n = 5$), and those treated with actinomycin D ($5 \mu\text{g ml}^{-3}$). One-way ANOVA, NS: non-significant.
- E Seahorse extracellular flux assay showing ECAR and OCR in IMR32, SH-SY5Y, LoVo, or PC-3 cells stably transfected as indicated ($n = 6$). One-way ANOVA, $*P < 0.05$ versus mock or sh-Scb.

Data information: Data are presented as mean \pm SEM. Exact P values are specified in Appendix Table S4.
