

**Additional file 3:** Number of contacts in men, stratified on healthcare setting and age

Number of contacts are presented as crude rates of mean number of contacts per month. Consultation rate ratios were adjusted for age, comorbidity, educational level, marital status, primary cancer type and time since completion of primary cancer treatment. Patients in remission served as the reference group. Black lines represent 95% confidence intervals. Estimates for men with second primary cancer and aged 18-49 years are omitted due to few observations to adhere to current data privacy protection legislation.
