## **eMethods 1. Evolution of NGO Contracting Models for Health Service Delivery in Afghanistan**

### **History and Rationale for Introducing Contracting Mechanisms**

After decades of war, Afghanistan had virtually no health system and infrastructure. An effective and rapid approach was needed to scale up service delivery throughout the country, and specifically hard to reach areas. NGOs had a strong presence throughout the nation, and were keen and equipped with capacity, infrastructure and personnel to fill the gap. In consultation with development partners and key funders, the Afghan Ministry of Public Health (MoPH) adapted an NGO contracting mechanism to rapidly deliver the basic package of health services (BPHS) nationwide [10-12].

### **Evolution of the Contracting Models: Contracting In vs Contracting Out**

Since 2003, the MOPH contracted well-established NGOs to deliver the services BPHS in a defined geographic area, which in most cases was a province. This process of “contracting-out” service delivery contracts to NGOs was implemented in 31 of 34 provinces. The MoPH was involved in selecting the NGOs through a competitive bid process, managing the contracts, and monitoring and evaluating performance. The contracts ranged from 12 to 36 months and NGOs were paid according to budgets that they submitted as part of their bids; full payment depended on achievement of agreed-on goals. Early on, NGOs were largely international, though over time, an increasing majority of contracts were awarded to Afghan NGOs. In 3 provinces (Parwan, Panjsher, Kapisa), the MoPH approach for service delivery was “contracting in” or recruiting managers to strengthen the existing MoPH. Coined the strengthening mechanism, this approach was designed to build capacity and strengthen service delivery in government facilities [10, 11].

### **The Essential Package of Hospital Services and Benefits Package**

The Essential Package of Hospital Services (EPHS) was implemented in 2005 and was designed to complement the BPHS by specifying the in-patient clinical and ancillary services and defining staffing, equipment and drugs for the three types of hospitals: district, provincial and national. The link between the BPHS and EPHS health services is the district hospital, which serves as the first referral-level hospital for primary care facilities. With the two packages, the MOPH specified all the services, staffing and equipment expected at every level of the Afghan health system [10].

## eMethods 2. Overview of Conflict Classification and Stepwise Modeling Approach

### Conflict classification

Consultations with country experts confirmed that the classifications using only BRDs most accurately reflected province-level conflict severity. We explored BRD classifications based on death counts and rates (total deaths/100,000 population) for 3 and 5 year periods. For sensitivity analyses, the province conflict ranking and all conflict-stratified analyses were compared using each categorization. Though some variation was noted in the provinces' conflict categorization, using count- vs rate-based conflict classification did not substantially change our effect estimates or inferences. We thus proceeded with classification based on counts since it's the recommended approach by Uppsala and conflict severity were most closely aligned with realities on the ground.

### Step-wise multivariable linear regression approach

To examine the association between conflict and child nutrition outcomes, we conducted a series of step-wise multivariable linear regression models using district-level (n=399) data. District-level child undernutrition outcomes (wasting, stunting, underweight, stunting & wasting) were obtained from Akseer et al 2018's Bayesian geospatial analysis of NNS 2013 data <sup>1</sup>. Conflict was measured using 4-year battle-related death totals for each district with a log transformation to account for right skewness. The 4-year lag period (2010-2013) was selected to align NNS 2013 anthropometry data with an appropriate conflict exposure period and potential impact on child growth and adverse nutrition outcomes <sup>2</sup>. Analyses were conducted in 3 stages (models) using ordinary least squares (OLS) regression, adjusting for potential sources of confounding related to nutritional outcomes <sup>3</sup>. Model 1 was simple crude associations between the exposure and outcome variables. Model 2 included model 1 + adjustments for household poverty (% population in the poorest 2 quintiles) and maternal illiteracy. Model 3 included model 2 + adjustments for household lack of access to improved water and sanitation sources. At each step, the crude and adjusted association between the conflict exposure and outcome was analyzed for statistical significance. Multicollinearity among adjustment variables was evaluated using variance inflation factors (VIF) where VIF>3 were considered suspect for collinearity. Model diagnostics such as graphical conditional studentized residuals and fixed effect influence statistics were accessed to assess model fit. Model parameters ( $\beta$ ) were estimated with 95% confidence intervals and standardized  $\beta$ s were estimated to determine relative ranking (importance) of model covariables to each outcomes. Statistical significance was established at p<0.05 and SAS v 9.4 was used for analysis.

**eTable 1. Survey Sample Sizes**

| Survey       | Under-5<br>Sample Size | Women age 15-49 years<br>Sample Size |
|--------------|------------------------|--------------------------------------|
| MICS 2003/04 | 25,777                 | 21,677                               |
| MICS 2010/11 | 15,320                 | 22,052                               |
| NNS 2013     | 24,348                 | 26,901                               |

\*women were defined as 12-49 years

**eTable 2. Overview of Data Sources Used for Each of Our Analyses**

| Outcome(s)                | Data Source(s)   | Analytical Strategy  |
|---------------------------|--|--|
| Child anthropometry       | Afghanistan National Nutrition Survey (NNS) 2013 / Akseer et al. (2018)                            | Hierarchical multivariable linear regression models using district-level (n=399) data                        |
| RMNCH                     | Multiple Indicator Cluster Surveys (MICS) 2004, MICS 2010-11, Afghanistan Health Survey (AHS) 2018 | Difference-in-difference (DID) analysis using generalized linear models and generalized estimating equations |
| Health system performance | Afghanistan Balanced Scorecards (BSC) 2004-2016  | Difference-in-difference (DID) analysis using generalized linear models and generalized estimating equations |

**eTable 3. Reproductive, Maternal, Newborn and Child Health (RMNCH) Intervention Definitions**

| Indicator   | Definition   |
|---|--|
| Current use of contraceptives (any method) (CPU)                  | Prevalence of current contraceptive use among married women 15-49 years old, any method                              |
| Current use of contraceptives (any modern method) (CPUM)          | Prevalence of current contraceptive use among married women 15-49 years old, any modern method                       |
| At least one antenatal care (ANC) checkup from a skilled provider | Percentage of women attended at least once during pregnancy by skilled health personnel                              |
| Skilled birth attendance (SBA) at last delivery                   | Percentage of live births attended by skilled health personnel   |
| Facility births   | Percentage of births delivered in a health facility  |
| BCG vaccination (BCG)   | The percentage of children aged 12-23 months who have received at least one dose of Bacillus Calmette-Guérin vaccine |

|  |   |
|--|---|
| DPT3/Penta 3 vaccination (DPT3)                    | The percentage of one-year-olds who have received three doses of the combined diphtheria, tetanus toxoid and pertussis (DTP3) vaccine in a given year   |
| Measles vaccination (MSL)                          | The percentage of children aged 12-23 months who have received at least one dose of measles-containing vaccine in a given year  |
| Care seeking for Acute Respiratory Infection (ARI) | Percentage of children under age five with symptoms of acute respiratory illness (ARI) during the two-week period before the survey and, among children with symptoms of ARI, the percentage who were taken to an appropriate health provider   |
| Oral Rehydration Therapy (ORT) use for diarrhea    | Percentage of children under age five ill with diarrhea during the two-week period before the survey and, among children ill with diarrhea, the percentage who received Oral Rehydration Solution (ORS) (ORS packet or pre-packaged ORS fluid)  |
| Composite Coverage Index (CCI)                     | <p>The CCI is a weighted average of 8 core indicators: demand for family planning satisfied, ANC 1+ visit, skilled birth attendance, BCG vaccine, 3 doses of DPT vaccine, measles vaccination, oral rehydration with continued feeding for diarrhea treatment, and care seeking for acute respiratory infection</p> $CCI = \frac{1}{4} \left( FPS + \frac{\frac{SBA + ANC}{2}}{2} + \frac{\frac{2 DPT3 + MSL + BCG}{4}}{4} + \frac{\frac{ORT + ARI}{2}}{2} \right)$ |

**eTable 4. Health Systems Performance Domains and Indicators**

Note: All domains and indicators measured as percentages ranging from 0-100 where higher values indicate better performance.

| Domain                                  | Definition  |
|---|---|
| Domain A: Client and community feedback | A composite score examining viewpoints of clients of BPHS facilities and community members on overall client satisfaction, perceived quality of care and community involvement in decision-making.  |
| Domain B: Human resource                | A composite score documenting experience of BPHS facility employees on health worker satisfaction, motivation, salary, staffing, provider knowledge and staff training.   |
| Domain C: Physical capacity             | A composite score measuring the BPHS facility's capacity to provide health care in the following areas: equipment functionality, pharmaceuticals and vaccine availability, laboratory functionality, existence of clinical guidelines, and physical infrastructure (e.g. heat, water, etc).                       |
| Domain D: Quality of service provision  | A composite score measuring the technical aspects of service delivery and the patient-provider interaction through examining appropriateness of: client background and physical assessment, patient counseling, precautions and safety measures to prevent infection and injury, and time spent with the patient. |
| Domain E: Management systems            | A composite score that measures functions related to the management of health facilities including use of health management information systems (HMIS), financial systems, and facility management functionality.   |
| Domain F: Overall mission               | A composite score that measures the extent to which the facility promotes greater access to health care for females and the poor.   |
| Overall means                           | An overall ranking of health systems performance based on above domains.  |

|                             |  |
|-----------------------------|--|
| Select component indicators | <ul style="list-style-type: none"><li>• Equipment functionality index</li><li>• Drug availability index (post-2010: Pharmaceuticals and vaccines availability index)</li><li>• Infrastructure index (post-2010: Functional infrastructure index)</li><li>• Patient history and physical examination index (post-2010: Client background and physical assessment index)</li><li>• Patient counseling index (post-2010: Client counseling index)</li><li>• Female health worker index</li><li>• Provider knowledge score</li></ul> |
