**Suppl. Fig. 1:** Bar charts illustrating the diversity of archaeal communities on genus level in dependence of primer pair combinations. Primer combinations are illustrated via the colored bars above the columns (first primer pair), and by letters below the columns (second primer pair). In addition, information is given on the different purification kits that have been used between the two steps of the nested PCR. If no character is given next to the letter, MinElute PCR Purification kit (QIAGEN) has been used to purify the PCR product. Only samples with more than 100 archaeal reads have been used for creating the bar charts.
