<sup>1</sup>All values are beta estimates obtained from multivariable-adjusted linear regression modeling 5-SD increments in EDIP or 5-unit increments in CRP as the main predictor of interest and metabolite as the main response variable of interest.

<sup>2</sup>Models were adjusted for body mass index (continuous) age, physical activity, educational level, race/ethnicity, aspirin/NSAIDs use, smoking status, WHI Hormone Therapy trial arm, CHD case-control status.

<sup>3</sup>Statistical significance was defined as false-discovery rate adjusted p<0.10.

Supplemental Table 2. Forty-five metabolites were significantly associated with EDIP at an FDR-adjusted  $P<0.10$ , among overweight or obese women in the discovery dataset (Hormone Therapy trial: n=792)<sup>1,2,3</sup>

<sup>1</sup>All values are beta estimates obtained from multivariable-adjusted linear regression modeling 5-SD increments in EDIP or 5-unit increments in CRP as the main predictor of interest and metabolite as the main response variable of interest. Metabolite associations in **bold face** are the EDIP replicated associations (FDR-adjusted  $P<0.10$ ) that were also significantly associated with CRP at FDR-adjusted  $P<0.10$ .

<sup>2</sup>Models were adjusted for body mass index (continuous) age, physical activity, educational level, race/ethnicity, aspirin/NSAIDs use, smoking status, WHI Hormone Therapy trial arm, CHD case-control status.

<sup>3</sup>Statistical significance was defined as false-discovery rate adjusted  $p<0.10$ .
