Tissue classification by rapid evaporative ionization mass spectrometry (REIMS): comparison between a diathermic knife and CO₂ laser sampling on classification performance

Michele Genangeli, Ron M.A. Heeren, Tiffany Porta Siegel

Table of content

Figure S1 – Home built laser arm used to maintain the laser in a fixed and safe position during analysis [a]. Control box for the safety arm includes height control to ensure that the laser is at optimal focus position on the tissue analyzed[b].	3
Figure S2 – Laser-REIMS spectra obtained from sampling chicken liver with different modalities. CW = continuous wave, Pulsed and super pulse modalities).	4
Figure S3 –Mass spectra obtained from a cow liver sampled using the MALDI-Orbitrap and zoom in the region between m/z 1200-1400. No clusters are visible in the higher mass range.	5
Figure S4 – REIMS-LDA-3D score plot including all data acquired from sampling soft tissue types. L=laser. k=diathermic knife.	6
Figure S5 - Laser REIMS-LDA-3D score plot including data acquired from sampling soft tissue types but excluding the data related to duck skin. L=laser. k=diathermic knife.	6
Figure S6 - Laser REIMS-LDA-3D score plot including data acquired from sampling soft tissue types but excluding the data related to duck skin and duck liver. L=laser. k=diathermic knife	7
Figure S7 - Visualization of bone damage induced by laser sampling using different modalities available with the CO2 laser system. CW = continuous wave	8
Table S1 - Lipid identification from REIMS and MALDI-MS measurements of cow liver tissues. CE= collision energy (eV), Measured REIMS = measured m/z with REIMS-TOF system, Orbitrap = measured m/z with Orbitrap system, Theor.Mass = Theoretical mass (m/z), ppm err = calculated error in part-per-million (for REIMS, Orbitrap), Prod ion = Product ion (m/z, for REIMS), Fragments id = fragments identification, Id = Lipid identification	9
Table S2 - Lipid identification from chicken liver measurements. CE= collision energy (eV), Measured REIMS = measured m/z with REIMS-TOF system, Orbitrap = measured m/z with Orbitrap system, Theor.Mass = Theoretical mass (m/z), Ppm err = calculated error in part-per-million (for REIMS, Orbitrap), Prod ion = Product ion (m/z, for REIMS), Fragments id = fragments identification, Id = Lipid identification	10
Table S3 - Lipid identification from cow muscle measurements. CE= collision energy (eV), Measured REIMS = measured m/z with REIMS-TOF system, Orbitrap = measured m/z with Orbitrap system, Theor.Mass = Theoretical mass (m/z), Ppm err = calculated error in part-per-million (for REIMS, Orbitrap), Prod ion = Product ion (m/z, for REIMS), Fragments id = fragments identification, Id = Lipid identification	11
Table S4 - Lipid identification from chicken muscle measurements. CE= collision energy (eV), Measured REIMS = measured m/z with REIMS-TOF system, Orbitrap = measured m/z with Orbitrap system, Theor.Mass = Theoretical mass (m/z), Ppm err = calculated error in part-per-million (for REIMS, Orbitrap), Prod ion = Product ion (m/z, for REIMS), Fragments id = fragments identification, Id = Lipid identification	12
Table S5 – Results from the spectra comparison between the laser and diathermic knife.	13
Table S6 - Peak lists reporting m/z values used to create the different peak list-based models. The m/z values are reported in order of importance for the discrimination of each tissue with the most important values on top. For the “All” model, a combination of peak lists was used accordingly to the tissues included in the model.	14
