

**Fig. S1.** Typical results of the pathogenicity tests on the Chinese cabbage leaves of Pcc strains. (A) Development of the soft rot symptom calculated using the time-laps images, MAFF 301875 (solid line) and MAFF 301879 (dotted line). Note that the onset of the symptom development (arrowhead) of was MAFF 301879 delayed. (B) Images of the developed symptom of both strains.

Table S1. Characterization and classification of AHL biosynthesis of *Pcc* strains

| Strain      | Cross streak assay <sup>a</sup> |       |          | QS class <sup>b</sup> | ExpI clade <sup>c</sup> | Accession no. |
|-------------|---------------------------------|-------|----------|-----------------------|-------------------------|---------------|
|             | CV026                           | VIR07 | AHL type |                       |                         |               |

<sup>a</sup> AHL-production type I, strongly induces violacein production in VIR07 (++) but weakly in CV026 (+). AHL-production type II, strongly induces violacein production in CV026 (++) but weakly in VIR07 (+). AHL-production type III, does not induce violacein production no induction in both CV026 and VIR07 (-).

<sup>b</sup> QS class I, produces 3-oxo-C8-HSL as a major AHL. QS class II-1, produces 3-oxo-C6-HSL as a major AHL. QS class II-2, produces a small amount of 3-oxo-C6-HSL.

<sup>c</sup> ExpI is divided into two clades (clade I and II) at an identity level of 75%. ExpI clade I is additionally divided into two subclades (clade I-1 and I-2) at an identity level of 95%.

Table S2. The production ratio of AHL extracted from the culture supernatant of *Pcc* strains

| Strain      | Production ratio (%) |        |              |        |               | QS class |
|-------------|----------------------|--------|--------------|--------|---------------|----------|
|             | 3-oxo-C6-HSL         | C6-HSL | 3-oxo-C8-HSL | C8-HSL | 3-oxo-C10-HSL |          |
