

Additional file 4: Figure S3. Plasma EVs carry cytokines. Separated EVs from 12 HCs were fixed, permeabilized and stained with fluorescence-conjugated antibodies against the indicated cytokines. **a.** The percentage of EVs expressing each cytokine was determined by high resolution multicolor flow cytometry. Representative dot plots present results of all tested cytokines in total plasma from one HC. **b.** EVs expressing each cytokine were gated and plotted to a FSC-H vs. SSC-A plot. Representative density dot plots present the distribution of gated cytokine expressing EVs in the various EV subsets. (FSC-H: Forward Scatter-Height; SSC: Side Scatter-Area.)
