

**Additional file 5: Figure S4.** The percentage of CD61<sup>+</sup>CD41a<sup>+</sup> vesicles was low in the separated plasma EVs. Separated EVs were stained with fluorescence-conjugated antibodies against the indicated surface markers. The percentages of EVs expressing each tested molecule were determined by high resolution multicolor flow cytometry. The graphs present summary percentages of CD61<sup>+</sup>CD41a<sup>+</sup>, CD61<sup>+</sup>CD41a<sup>-</sup> and CD61<sup>-</sup>CD41a<sup>+</sup> vesicles in plasma EV subsets from HCs (n=28).
