Odds ratios (lower and upper 95% CI) are per 1 unit (i.e. risk allele) of each SNP/variant.

Associations are estimated from logistic regression, adjusted for age and sex. Results highlighted in bold font are statistically significant at the 5% level. DR3 refers to HLA-DRB1*03 and DR4-DQ8 to HLA-DRB1*04 with DQB1*03:02.

Model 1: age (as underlying time scale), sex, center; Model 2: age (as underlying time scale), sex, center, physical activity, smoking status, education; Model 3: age (as underlying time scale), sex, center, physical activity, smoking status, education, family history of diabetes. I² represents % of variability due to heterogeneity between countries. "High" GAD65 antibody⁺ are defined as GAD65 antibody ≥ 167.5 U/ml and "Low" GAD65 antibody⁺ are defined as GAD65 antibody ≥ 167.5 U/ml.

Odds ratios are per 1 unit (i.e. risk allele) of each SNP/variant.

Associations are estimated from logistic regression, adjusted for age and sex.

Models fit within each country; estimates combined across countries using random effects meta-analysis.

The rs7903146 (SNP at TCF7L2 locus) is highlighted in bold font.

Values presented are percentages for categorical variables, mean (SD) for continuous variables except for GAD65 antibody, which has a skewed distribution, so median (IQR) is presented.

* Of the 15,802 members of the subcohort presented in Table 1 who all had GAD65 antibody status, 3,023 individuals did not have data for the type 1 diabetes genetic risk score, so are excluded from this table, which therefore includes N=12,779 individuals.
