

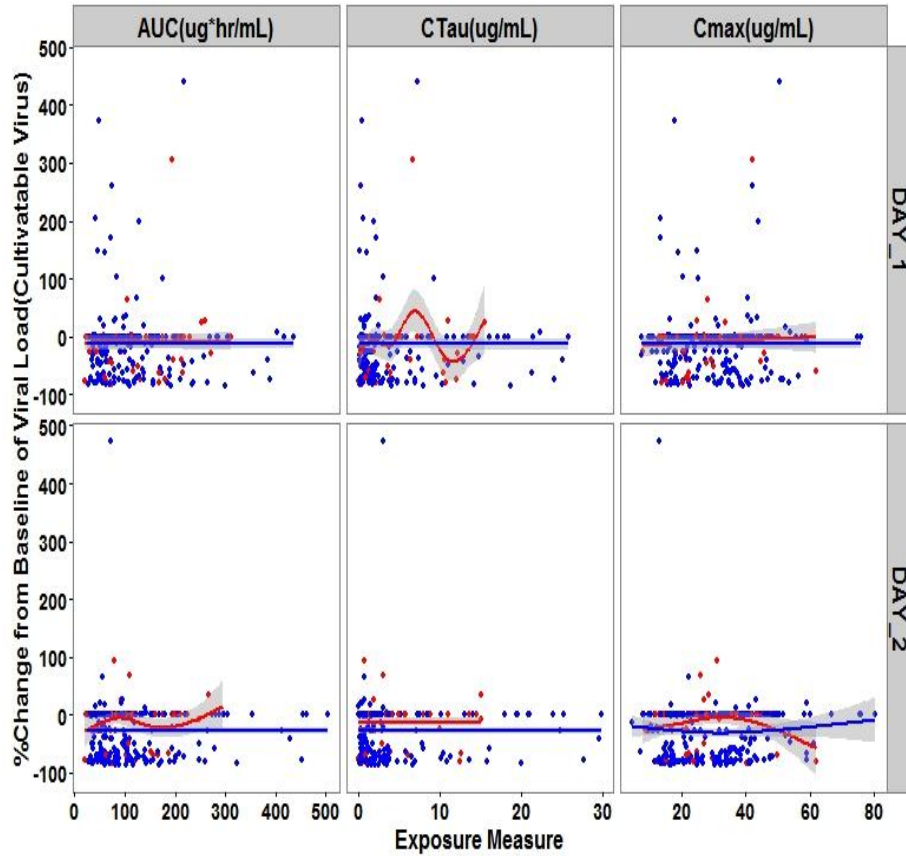

Figure S1: Change from Baseline of Viral Load (Quantitative Virus Culture) by Exposure Measures for Day 1 and Day 2

Note: In all these plots, blue dots are observations and blue line is local regression smoothing line (95% CI shaded region) for individuals who had symptom onset within 4 days before start of zanamivir treatment; red dots are observations and red line is local regression smoothing line (95% CI shaded region) for individuals who had symptom onset more than 4 days before start of zanamivir treatment; Time on x-axis is day relative to baseline measure. Quantitative virus culture was measured in TCID₅₀/mL.
