

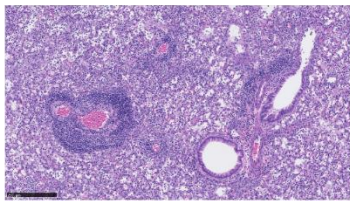

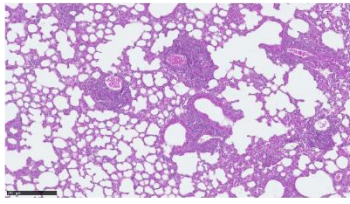

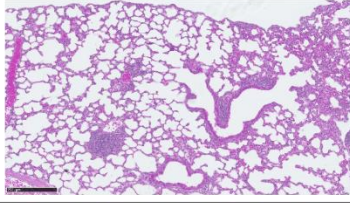

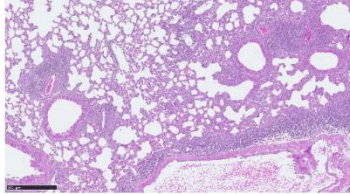

Figure A1. HMPV-immunized mice showed significant differences in histopathology 5 days after viral challenge.

After intranasal immunization with 5×10^5 TCID₅₀ of Δ SH-C-85473, Δ G-C-85473 or WT rC85473 virus, mice were inoculated with 1×10^6 TCID₅₀ (LD₅₀) of rC-85473 3-weeks later. Tissues observations ($\times 100$ magnification) and measure of pulmonary edema scores were performed on mice lungs on day 5 post-challenge (n=2).

		pulmonary edema score
challenged mice mock-immunized		1.5
challenged mice rC-85473 WT immunized		0
challenged mice Δ SH-C-85473 immunized		0
challenged mice Δ G-C-85473 immunized		0
