Supplementary Tables 1-4

Supplementary Figures 1-4

Table S1. Radiocarbon (^{14}C) and stable isotope ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$) data for individual bones of hutia (*Geocapromys ingrahami*) from the Bahamian Archipelago, proceeding roughly north-to-south in the island group. Beta-24481 is an old, time-averaged date determined on multiple bones (Morgan 1989). **Banks:** CAB, Crooked-Acklins Bank; CB, Caicos Bank; GBB, Great Bahama Bank; LBB, Little Bahama Bank; MB, Mayaguana Bank. **Site type:** (C), cultural site; (NC), non-cultural site. ^{14}C ages presented at 95.4% confidence (2σ). All analyses done at Beta Analytic Inc., Miami, FL. **, sample used successfully for aDNA extraction and is listed with associated UF FLMNH catalog number. *, sample used for aDNA extraction but did not yield a sequence. $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ are reported in per mille (o/oo). In the ^{14}C age (cal BP) column “post-0” means that the sample retains enough ^{14}C in it that it cannot (with statistical certainty) be distinguished from 0 (set at AD 1950).

Bank	Island	Site	Skeletal element	Beta-number	Conventional ^{14}C age (yr BP)	$\delta^{13}\text{C}$ (o/oo)	^{14}C age (cal BP)	^{14}C age (cal BC/AD)	$\delta^{15}\text{N}$ (o/oo)

Figure S1. MapDamage [58] plots for each of the ancient *Geocapromys ingrahami* samples included in our analyses organized by Bahamian island.

A. Fragment misincorporation plots for samples from Abaco. Left plot is the shotgun sequenced data (UF 322961), right plot is the targeted enrichment sample (UF 322959).

B. Fragment misincorporation plots for samples from Eleuthera. Left plot is the shotgun sequenced data (UF 322948), right plot is the targeted enrichment sample (UF 322947).

C. Fragment misincorporation plots for samples from Crooked Island. Left plot is the shotgun sequenced data (UF 322960), right plot is the targeted enrichment sample (UF 322949).

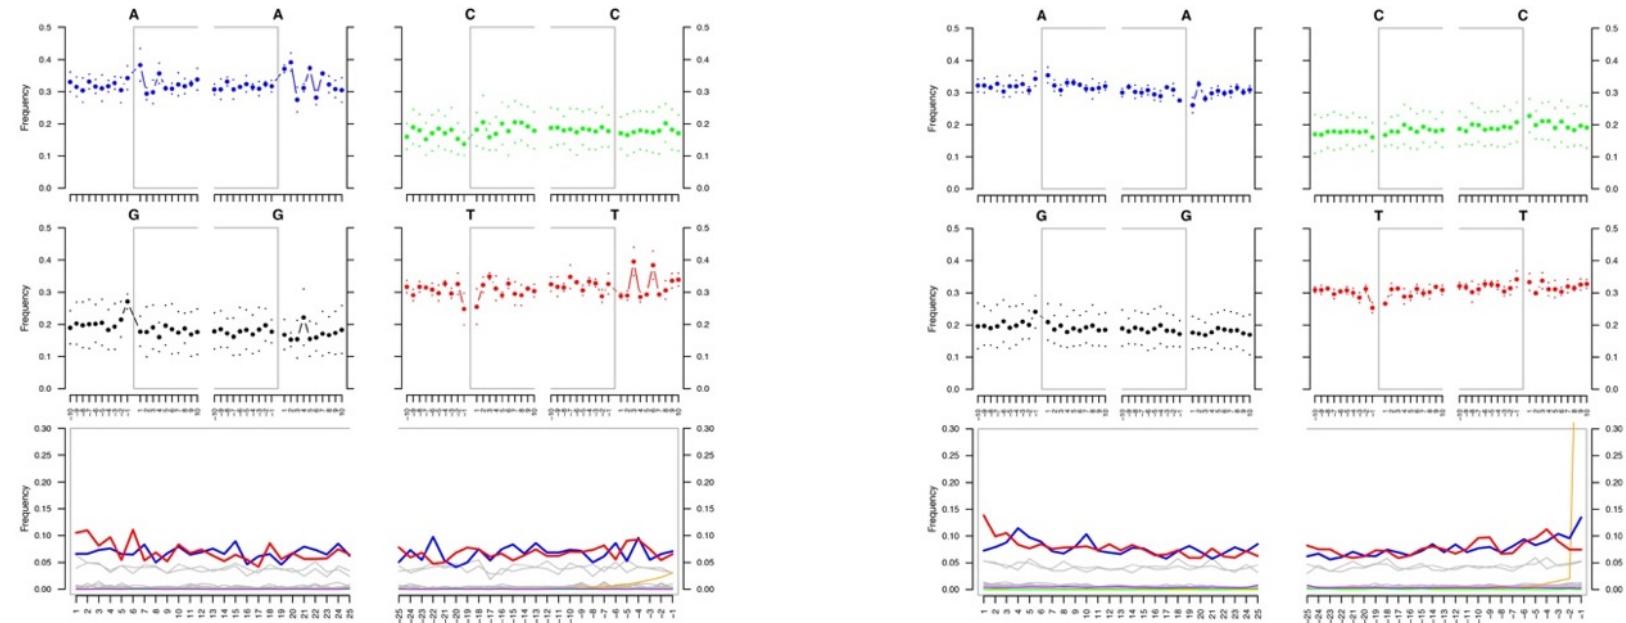

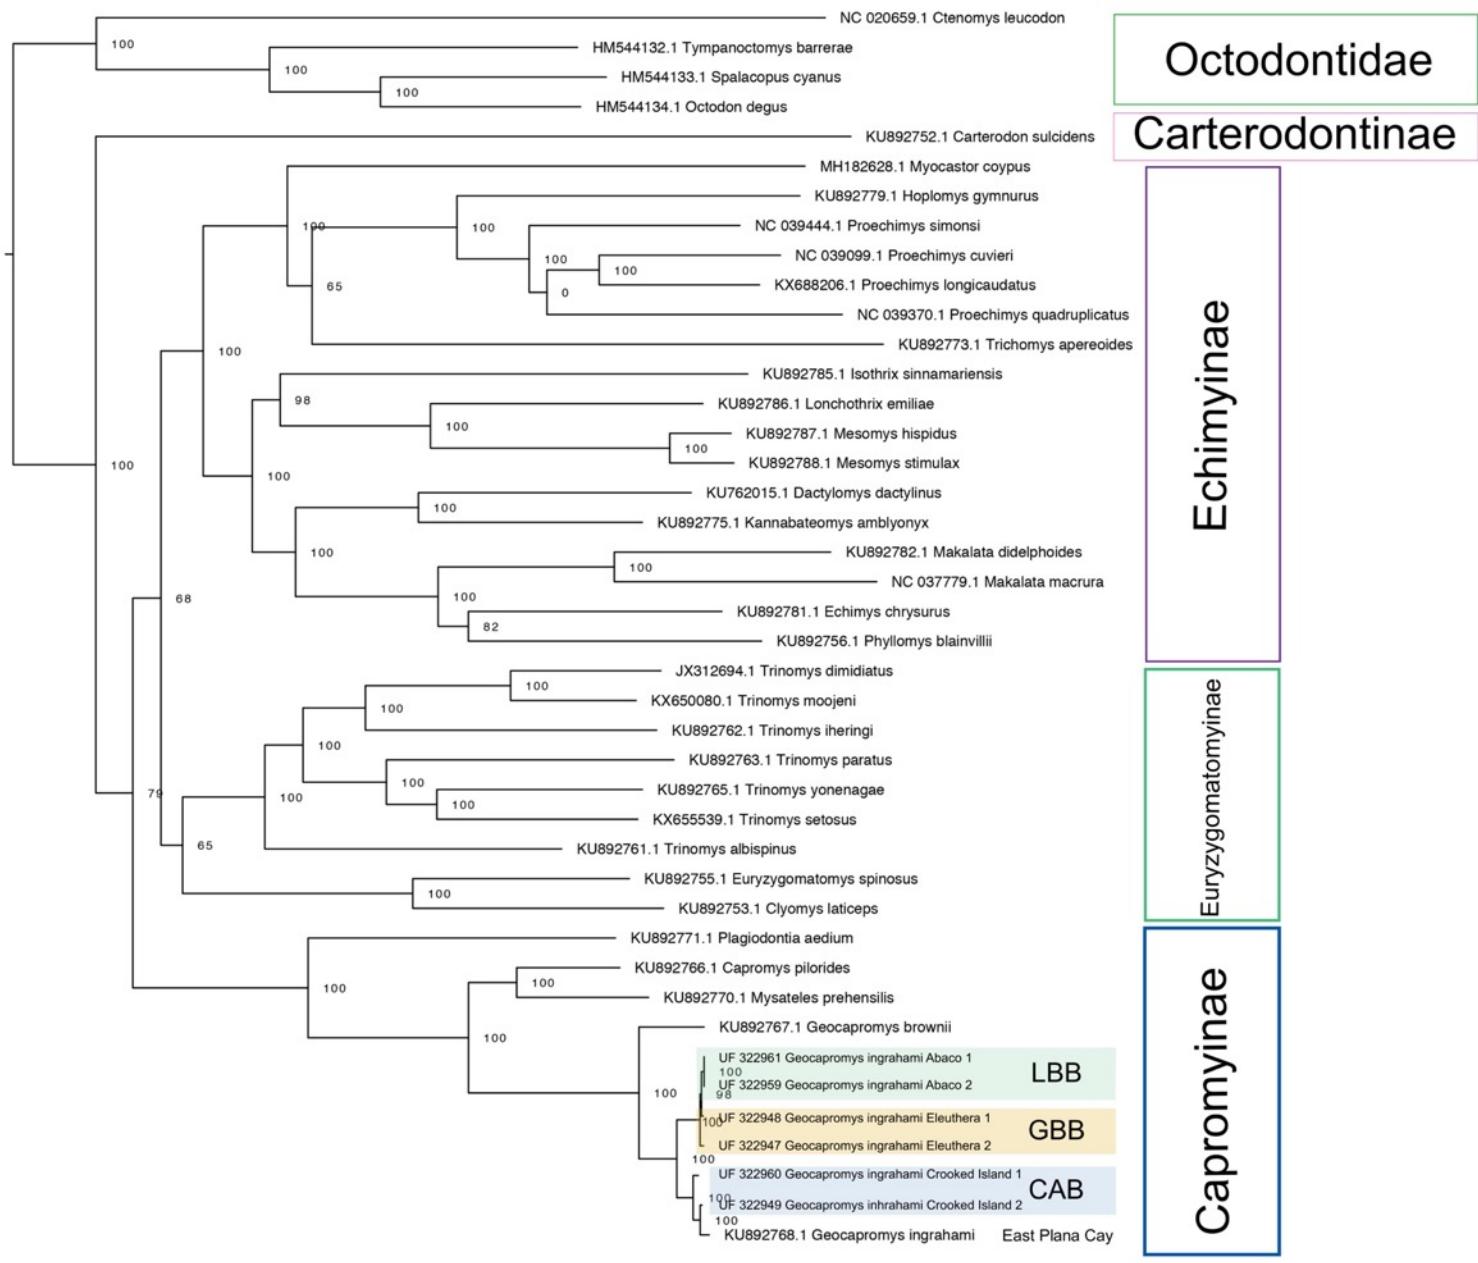

Figure S2. Partitioned RAxML [62] phylogeny. Bootstrap support is on the nodes. The *Geocapromys ingrahami* samples used for this study have the island they were sampled from in the label name. Shotgun sequenced samples have a “1” in the label, target enriched samples have a “2” in the label. LBB, Little Bahama Bank; GBB, Great Bahama Bank; CAB, Crooked-Acklins Bank.

0.08

Figure S3. BEAST2 [63] phylogeny with the 95% highest posterior density divergence time represented in millions of years on the nodes in parentheses followed by the median divergence time. The median divergence time for *Geocapromys ingrahami* is represented in Figure 3. The BEAST2 [63] phylogeny presented in the main text is a cropped version of this phylogeny. The Miocene Epoch (23 – 5.3 mya) is indicated by the purple box. The Pliocene Epoch (5.3 – 2.6 mya) is indicated by the white box. The Pleistocene Epoch 2.6 Ma to ~12,000 years ago is light blue. The Holocene Epoch began at the end of Pleistocene.

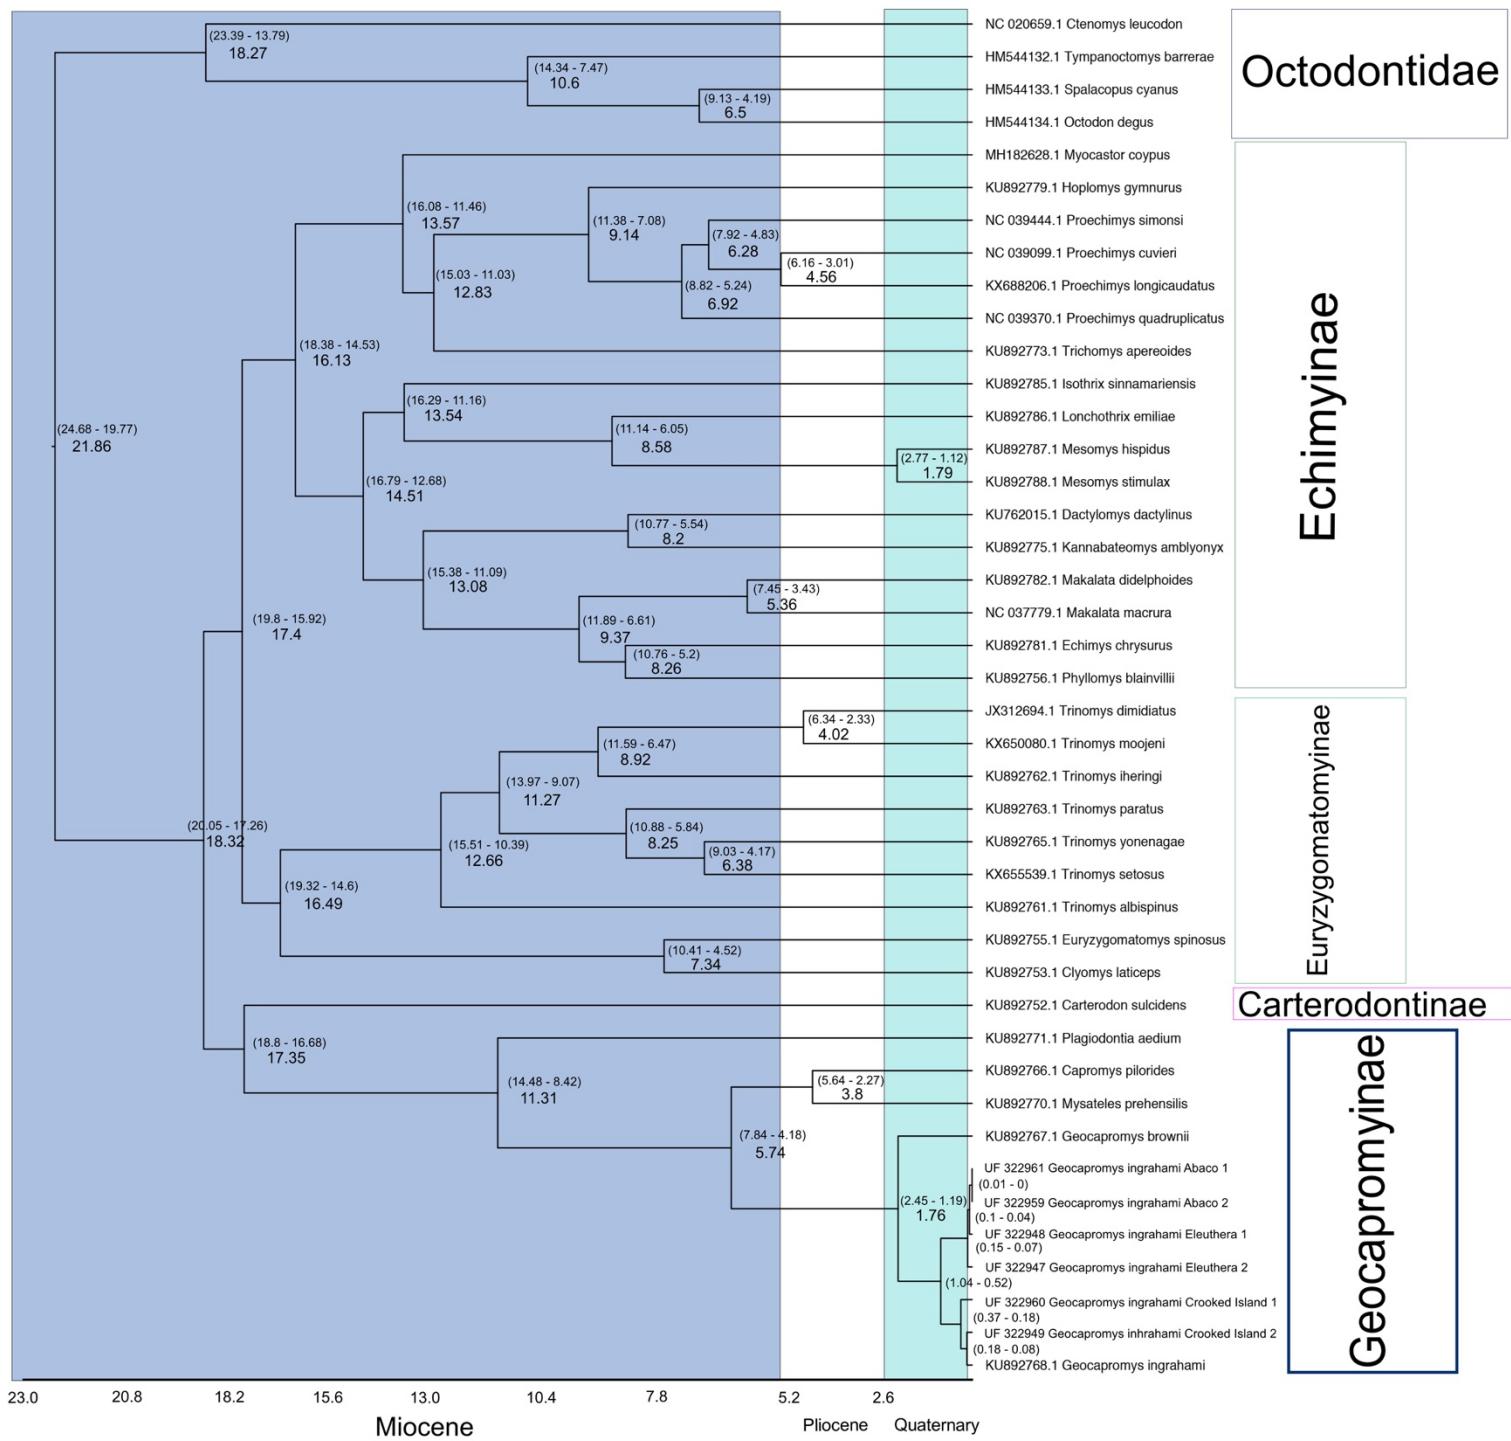

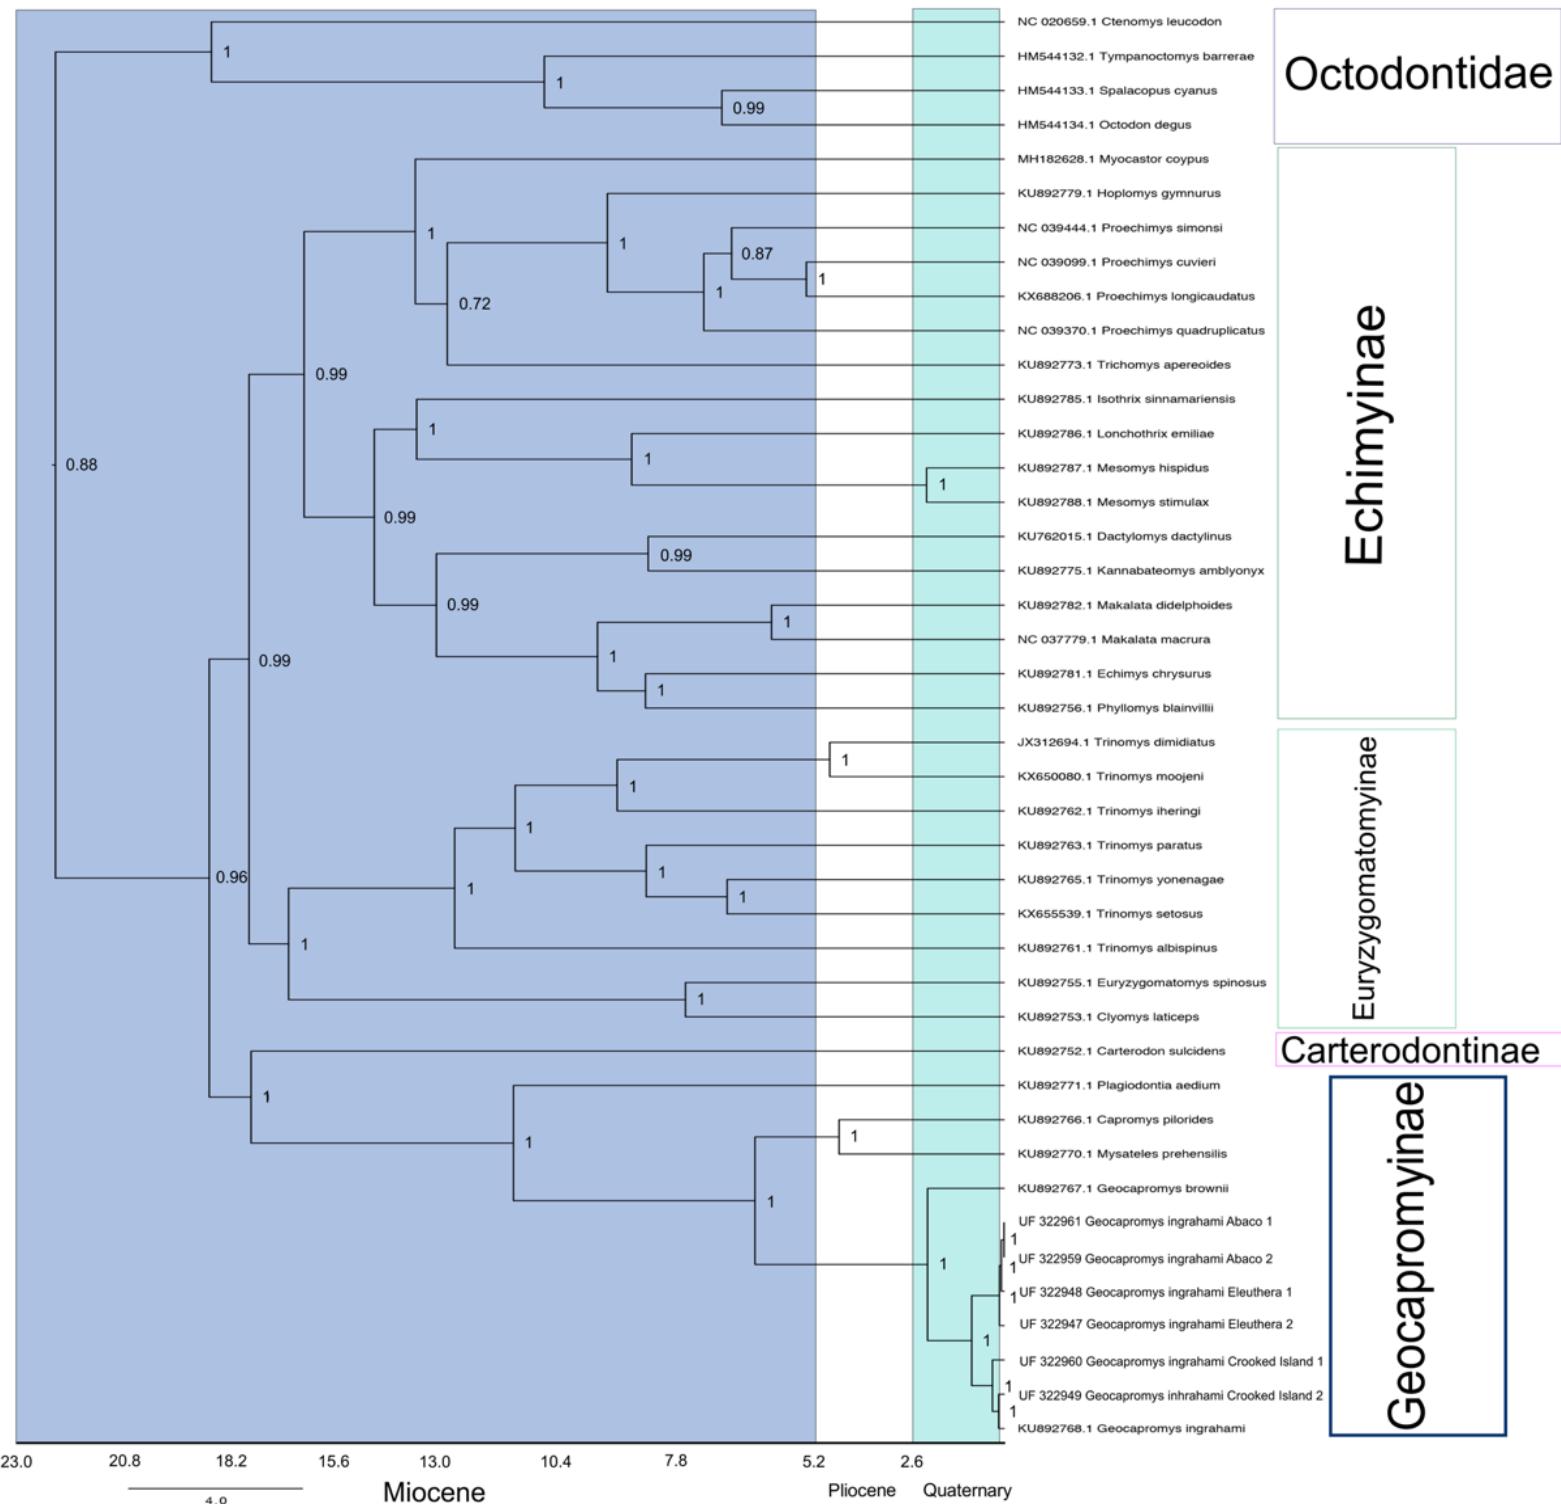

Figure S4. BEAST2 [63] phylogeny with posterior probability on the nodes. The color scheme for geological epochs is the same as Fig. S3.
