61

62 **Supplementary Figure S1**

63

64 **Supplementary Figure S1. Interaction of antibody response against different**
 65 **herpesviruses in association to MS.** Odds ratios (OR) and confidence intervals (CI) for A)
 66 IE1B and EBV, B) IE1B and CMV, C) 101K and EBV, and D) 101K and CMV were
 67 obtained through logistic regression models adjusted for age, sex and cohort type analyzing
 68 the Established MS cohort (n=8742 persons with MS and n=7215 controls). OR were
 69 calculated in relation to the group with the lowest MS risk. Plus (+) indicates being a strong
 70 responder while minus (-) indicates being a weak responder. Strong IE1B / 101K response is
 71 defined as having an MFI value being in the upper quartile of measured response, while a low
 72 response is having an antibody measurement being in the lower quartile of measured
 73 response. Strong EBV / CMV response is defined as having a higher EBV / CMV index than
 74 the median among controls, while a weak response is having a lower index compared to the
 75 median among controls.

76

84

85 **Supplementary Figure S2**

86

87

88 **Supplementary Figure S2. Moving OR analysis visualizing MS risk for high IE1A, IE1B**
 89 **and 101K responders, depending on EBV IgG response.** HHV-6A/-6B associated MS risk
 90 calculated using logistic regression analyses adjusted for age, sex and cohort type in a sliding
 91 window approach, i.e. stratified for EBV response in the established MS cohort (8742 persons
 92 with MS and 7215 controls). Strong responders are defined as those present in the highest
 93 quartile of each measured response, and in the regression models strong responders were
 94 compared to weak responders, here defined as those present in the lowest quartile of each
 95 measured response. Each analysis window contained a span of 0.75 units EBV index and
 96 overlapping analyses were performed as the window moved 0.015 units to its next analysis.
 97 Windows containing < 100 MS cases or < 100 controls were excluded which left 266 analysis
 98 windows, i.e. 266 plotted data points for each antigen response in the graph.

99

102

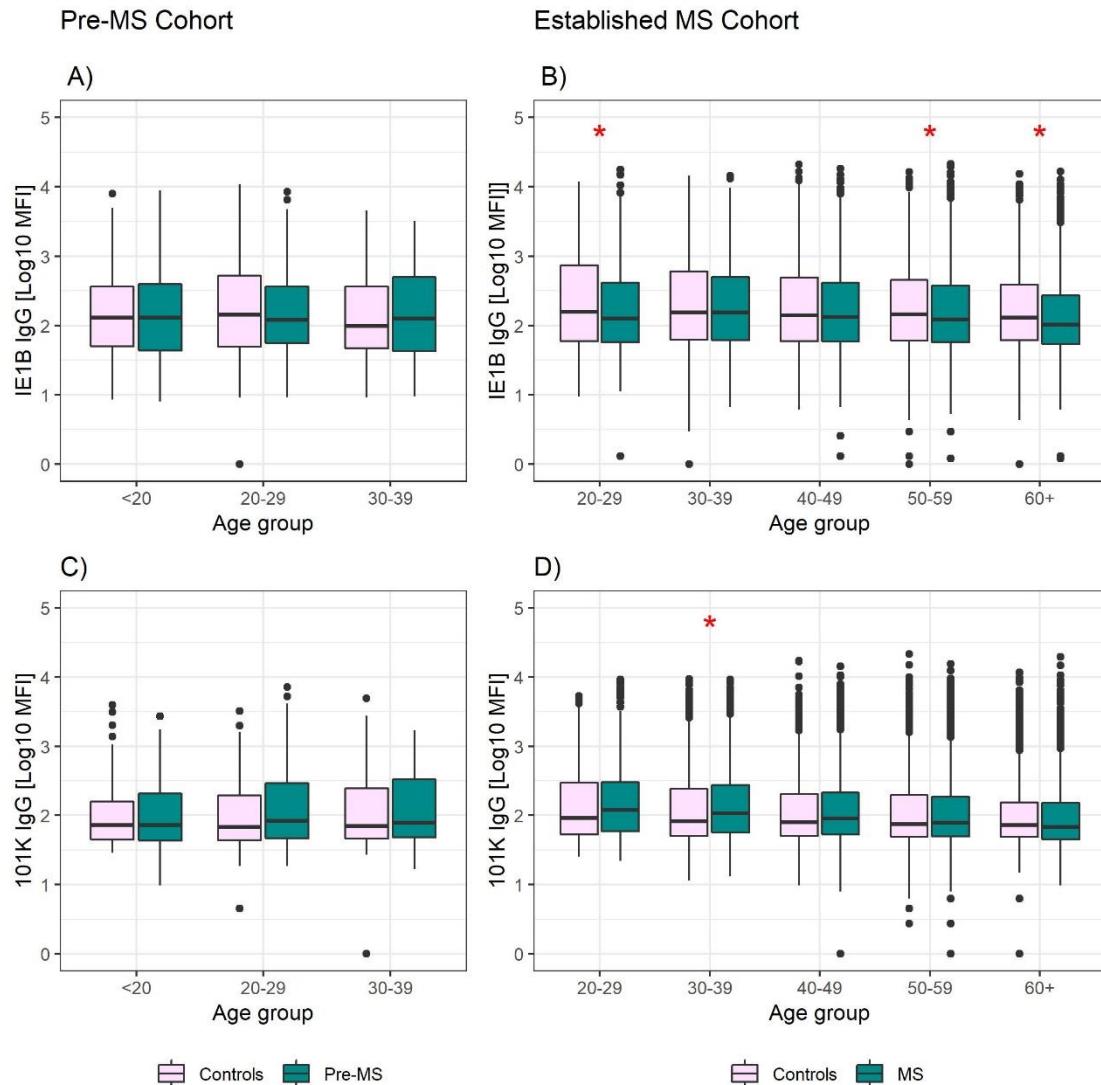

103

104

105

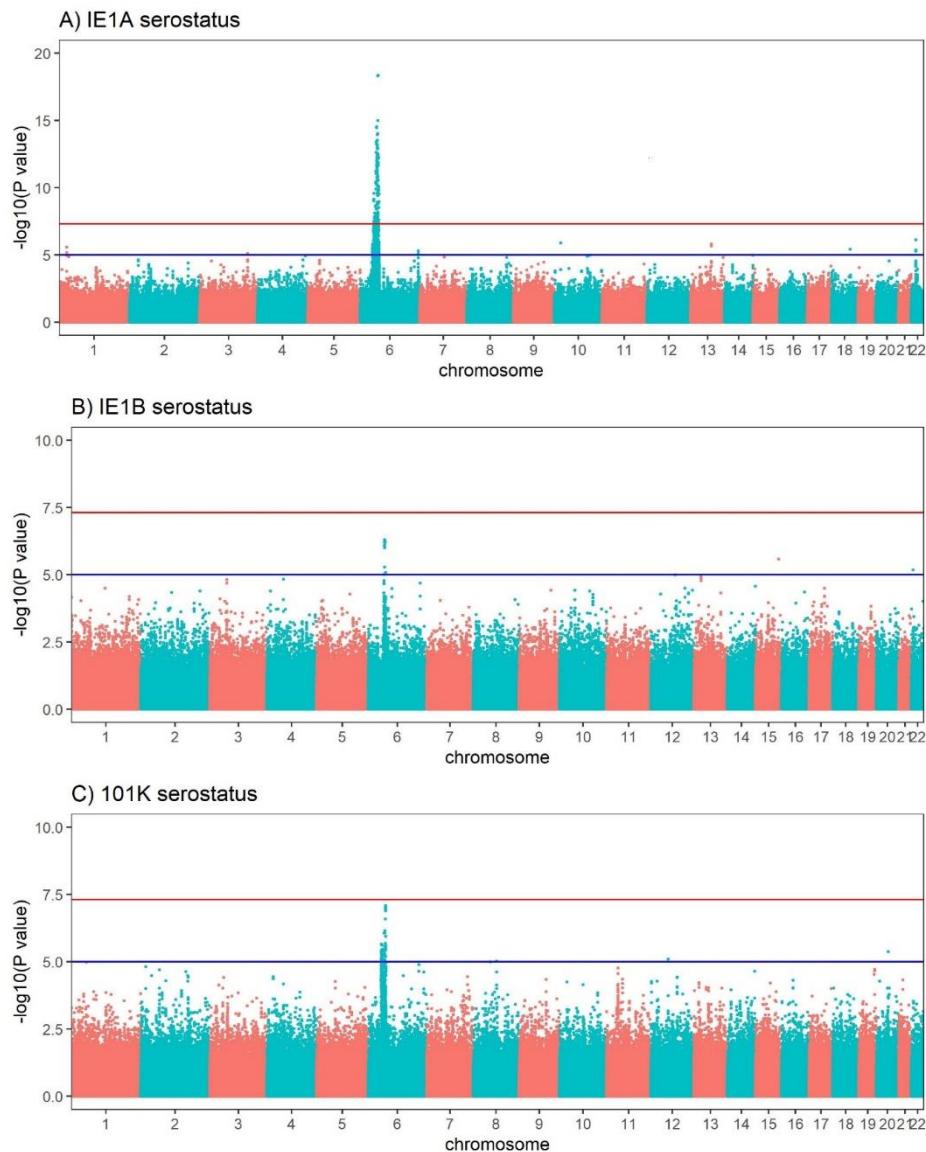

106 **Supplementary Figure S3**

107

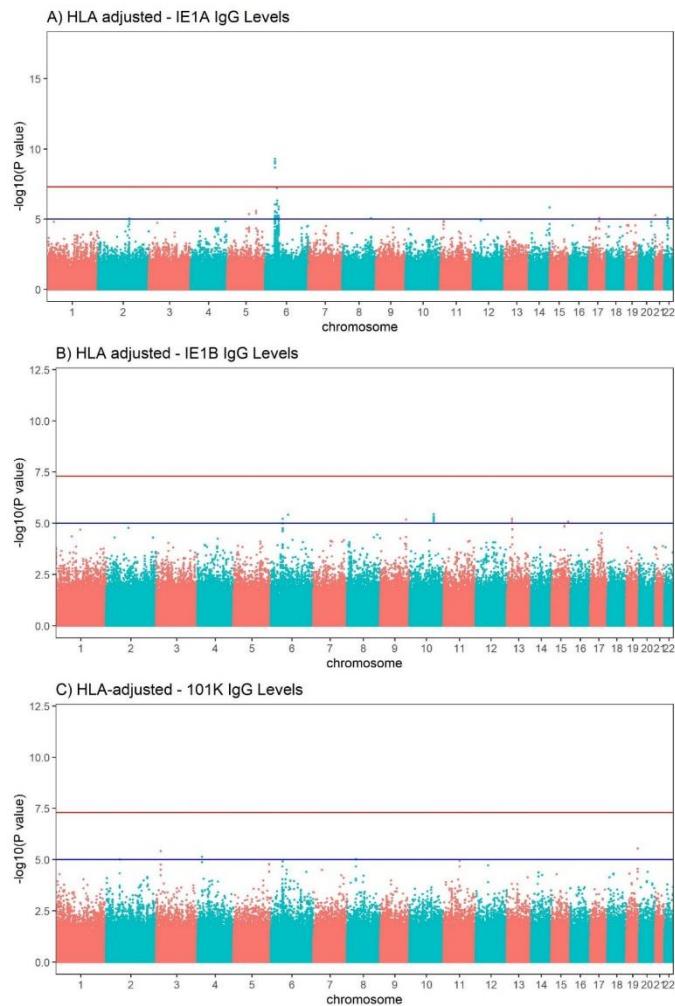

108

109 **Supplementary Figure S3. Median MFI response against HHV-6B proteins IE1B and**
 110 **101K in different age groups.** Median of median fluorescence intensity (MFI) in different
 111 age groups for pre-MS cohort (n=478 persons) who later developed MS (green) and n=476
 112 controls (pink); A, C) and established MS cohort (n=8394 persons with MS (green) and
 113 n=7214 controls (pink); B and D) for HHV-6B IE1B IgG (A and B); HHV-6B 101K IgG (C
 114 and D). Statistics were calculated with linear regression. Significant ($p<0.008$) differences in
 115 IgG levels between MS cases and controls within each age group are indicated with *.

116 **Supplementary Figure S4**

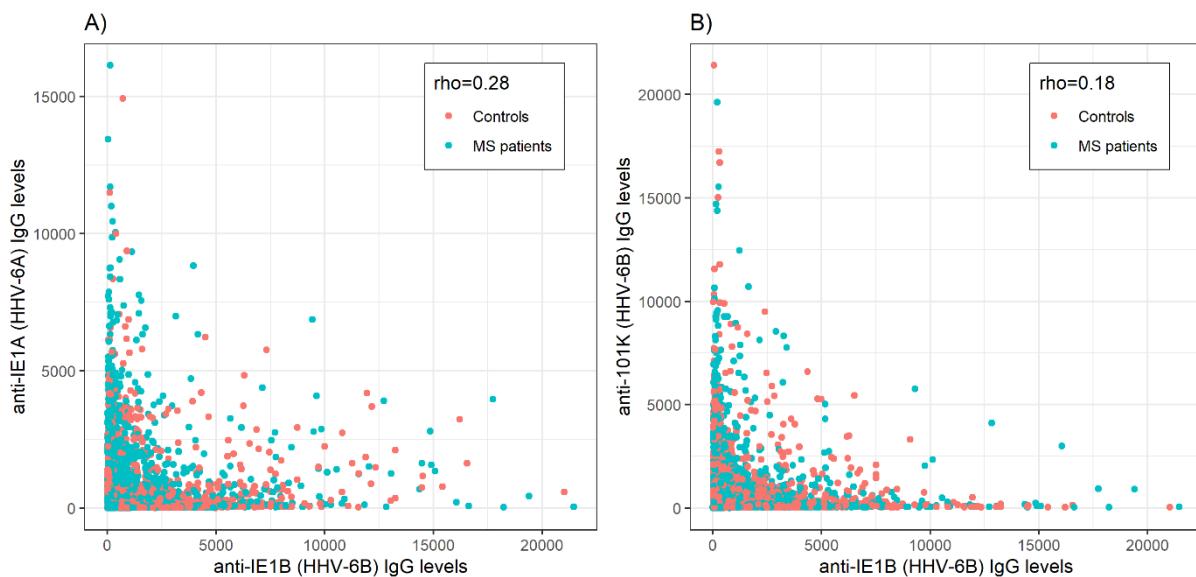

117

118 **Supplementary Figure S4. Manhattan plots visualizing associations between SNPs and**
 119 **anti-HHV-6A/6B protein IgG serostatus.** GWAS data showing associations between SNPs
 120 high/low IgG response, against (A) IE1A, (B) IE1B and (C) 101K. Red lines indicate GWAS
 121 significance level of 5×10^{-8} ($-\log_{10} = 7.3$ on the y-axis) and blue lines indicate suggestive
 122 association ($p=10^{-5}$). Association analysis was carried out in established MS cohort with
 123 available genotypes (n=6,396 persons with MS and n=5,530 controls).

124 **Supplementary Figure S5**

125

126 **Supplementary Figure S5. Manhattan plots of the association results when associated**
 127 **HLA alleles are added as covariates.** GWAS was performed between SNPs and A) IE1A,
 128 B) IE1B and C) 101K with linear regression models where HLA alleles associated to the
 129 responses were added to the model and adjusted for. Red lines indicate GWAS significance
 130 level of 5×10^{-8} ($-\log_{10} = 7.3$ on the y-axis) and blue lines indicate suggestive association
 131 ($p=10^{-5}$). In A) SNPs remaining significant after conditionen for HLA are rs1610678,
 132 rs1611149, rs173693 and rs915669. Association analysis was carried out in established MS
 133 cohort with available genotypes (n=6,396 persons with MS and n=5,530 controls).

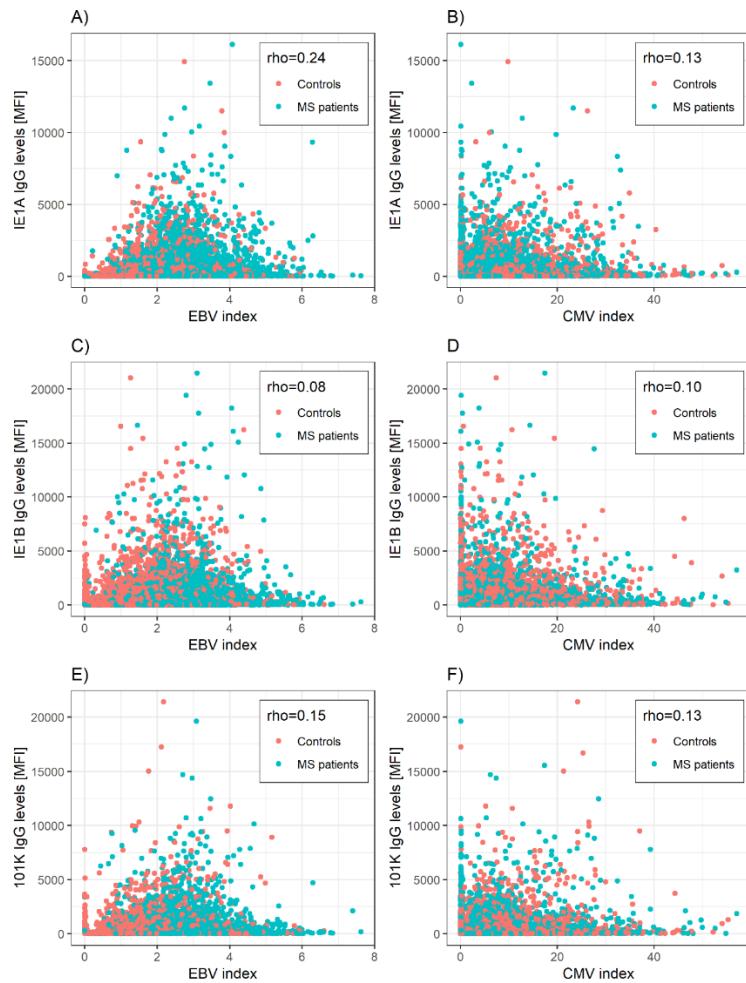

134 **Supplementary Figure S6**

135

136 **Supplementary Figure S6. Correlation between different antibody responses for HHV-**
 137 **A and B antigens.** Antibody levels measured as Median Fluorescence Intensity [MFI]
 138 against (A) IE1B and IE1A, (B) 101K and IE1B are plotted. Rho = Spearman's rank
 139 correlation coefficient. There is an inverse correlation between IgG levels against the different
 140 HHV-6 antigens, suggesting that different individuals respond with differently to the various
 141 antigens. Analysis was carried out in established MS cohort ($n=8742$ persons with MS and
 142 $n=7215$ controls).

143

144

Supplementary Figure S7

145

146 **Supplementary Figure S7. Correlation between anti-HHV-6A/6B, CMV and EBV**
 147 **serology.** Antibody levels [MFI] against IE1A, IE1B and 101K are plotted against EBV or
 148 CMV indexes. Rho = Spearman's rank correlation coefficient. There was a significant positive
 149 correlations between the different HHV-6 antibody responses and the EBV index ($\rho \leq 0.23$)
 150 as well as with the CMV index ($\rho \leq 0.15$). Being a strong IE1A responder was significantly
 151 associated with being a strong EBV responder, both in MS cases ($OR = 3.41, p = 7 \times 10^{-72}$) and
 152 in controls ($OR = 2.68, p = 2 \times 10^{-45}$). Analysis was carried out in established MS cohort
 153 ($n=8742$ persons with MS and $n=7215$ controls).

189 The allele variants in a given HLA haplotype are presented. Underlined alleles were conferring the strongest effect, determined by stepwise
 190 conditional analyses. HLA genotype data was available for 7,063 MS cases and 6,098 controls. ^AAdjustment #1 = Age, sex, 5 PCA vectors,
 191 cohort type (incidence or prevalence). When adjusted for HLA, one associated HLA allele from each associated haplotype (underlined in the
 192 table) were added to the model in order to test for independent association of the investigated HLA allele. Adjustment #2 = Adjustment #1 +
 193 HLA. When all subjects were analyzed together, MS affection status were added as a covariate. Haplotypes associated to 101K are shown if any
 194 allele in it has a p-value <0.001 indicated in bold.

200

201 The first sample (Pre) is collected during Exanthema subitum (ES) acute phase, the second sample (Post) is collected in the convalescent phase
 202 and days between the two samples are given in the table. When ≤ 7 days between the samples, the samples are marked grey. NT = not tested.
 203 Isolation of viable HHV-6 from blood is described in (Asano Y, et al 1989 journal of pediatrics 114:535-539). ^ Presence of DNA in cell-free
 204 plasma/serum was detected using the LAMP method (ref: Ihira 2004). If isolation of HHV-6 from blood sample was positive, the identification
 205 of HHV-6 species was performed by specific immunofluorescence staining with monoclonal antibodies to HHV-6 (Asano Y, et al 1989 journal
 206 of pediatrics 114:535-539) and if detection of HHV-6 DNA from serum using LAMP was positive, the identification of HHV-6 species was
 207 followed RFLP method by LAMP products. (Ihira et al J virol Methods 2008 154(1-2):223-225). ~ IFA was used for detection of antibody
 208 against the representative strain of HHV-6B isolated (FG-1) from patients with ES (Suga et al 1989 pediatrics 83(6)1003-6.). A serum dilution of
 209 1:100 was used in the assay and with that dilution MFI values <50 may be in the technical noise of the assay and should be interpreted with
 210 caution. The ability of this secondary antibody to detect IgM is limited, but we cannot be excluded

211 **Table S6. Amino acid sequences used as antigens in the multiplex serological assay.**

212 Amino acid similarity to the top-scored protein from another virus species, obtained with the NCBI BLAST function. If more than one Sequence
 213 IDs are given, the second ID is of special interest. The % identity is given by the protein BLAST matching, please note that the matched amino
 214 acid length is not always the same as the length as the used protein sequence.
