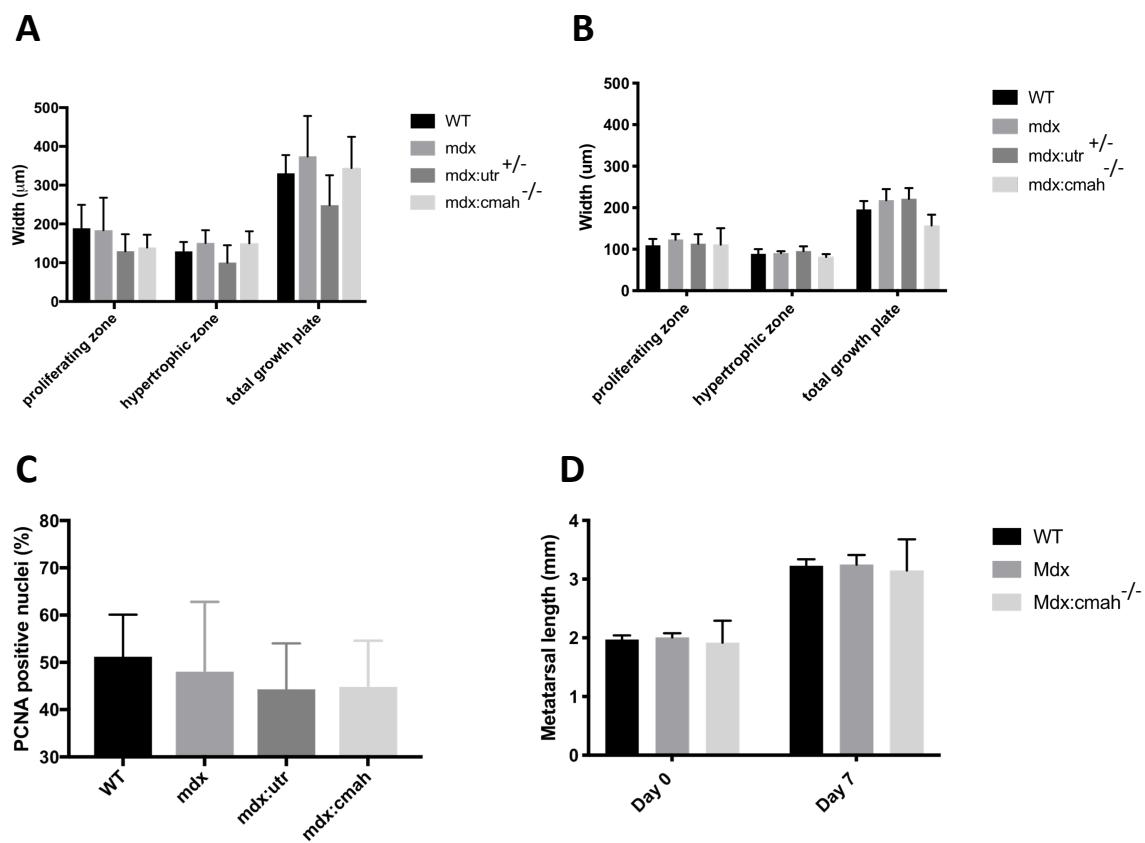

Figure S1. The width of the total growth plate and the individual proliferating and hypertrophic zones were similar at **A)** 3 weeks of age, and **B)** 7 weeks of age. **C)** The percentage of proliferating growth plate chondrocytes was similar in 3-week-old muscular dystrophy and WT mice. Data is presented as mean \pm SD ($n > 6$). **D)** The growth of cultured embryonic (E18) metatarsals from muscular dystrophy and WT mice were similar. Data is presented as mean \pm SD ($n = 12$ metatarsals).
