# Supplemental Table S2. Individual Study Characteristics by Outcomes

# A. Illicit Opioid Use

Study	Count	Study	Sampl	Cannabis Use	Outcome	Statistical	Results
	ry	Design	e Size (% Female	Definition		Analysis	
			)				
Best, 1999 (1)	UK	Cross sectional	200 (30%)	Method: MAP Definition: Categorical; daily users,	Method: MAP Definition: Continuous	ANOVA; post-hoc Scheffe test	F=11.07, p<.0001, such that non-users had more
				occasional users (used cannabis but not on all	; Mean number of days of		occasions of heroin use than occasional and
				30 days in previous months), and non-users	heroin use in the past 30 days from MAP		daily users
				<b>Timing:</b> Baseline	<b>Timing:</b> Baseline		
Epstein, 2003 (2)	USA	Secondary RCT analysis (3 separate analyses), 12 months	408 (40.44 %)	Method: Diagnostic Interview and urinalysis Definition: Dichotomized cannabis use and cannabis abuse/depende nce diagnosis Timing: Baseline and 12 months	Method: Urinalysis Definition: Relapse to heroin among patients who achieved abstinence (3 consecutive weeks of opioid abstinence) Timing: Time to lapse	Cox proportion al-hazard regression	Cannabis use: First two trials: HR = 1.54 (0.93–2.56); $\chi^2$ =2.78, p=0.095 Third trial: HR = 0.90 (0.48-1.65); $\chi^2$ =0.13, p=0.72 Cannabis abuse/depende nce: First two trials: HR = 1.16 (0.63-2.13); $\chi^2$ =0.22, p=0.64 Third trial: HR = 2.09 (0.76-5.76); $\chi^2$ =1.66, p=0.19
Levine, 2015 (3)	USA	Retrospecti ve cohort, 1 year	290 (40.34 %)	Method: Urinalysis Definition: Dichotomized cannabis use Timing: Baseline within the First month of drug testing	Method: Urinalysis Definition: Continuous ; Proportion of UDS results negative	Logistic Regression	Not significant, but statistics not reported.

Lions, 2014 (4)	France	Secondary RCT analysis, 45 weeks	158 (15.19 %)	upon entry into MMT  Method: Opiate Treatment Index Definition: Dichotomous; Daily users vs. non-daily users Timing: Baseline and 12 months	for opioids was calculated within the first year Timing: 12 months in treatment Method: Opiate Treatment Index Definition: Dichotomo us; Opiate users vs. non-opiate users (used opiates at least once in the past month) Timing: 12 months	Multiple logistic regression	Pre-treatment daily cannabis: OR=1.46 (0.61-3.77), ns In-treatment daily cannabis: OR=2.81 (1.22-6.48), p<.05
Nava, 2007 (5)	Italy	Prospective cohort, 12 months	121 (14%)	Method: Self report, Urinalysis Definition: Dichotomous; long term users (more than 6 months) and currently smoking at least 7 times per week vs. nonusers never exposed to marijuana smoking. Timing: Baseline	Method: Urinalysis Definition: Continuous ; Percentage positive opioid screens (missing specimens considered positive) Timing: Urine samples were collected once a week	Hierarchica I linear modelling	Cannabis users:  z=-3.42, p<.001, such that there was a reduced percentage of positive opioid urines.  Non-cannabis users: z=-3.18, p<.001, such that there was a reduced percentage of positive opioid urines.
Nirenberg , 1996 (6)	USA	Prospective cohort, 6 months	70 (1.42% )	Method: Urinalysis Definition: Dichotomized cannabis use;	Method: Urinalysis; Definition: Continuous ;	ANOVA	Dichotomized cannabis use: F(1,68)=0.90, p=.35, ns Four groups:

				and Categorical	Percentage		F(3,66)=1.13,
				4 groups: Group	positive		p=.34, ns
				1 - cannabis	opioid UDS		
				abstainers (0	Timing: 45		
				positive screens); Group	weeks

Wasserma n, 1998 (11)	USA	Prospective cohort, 6 months	74 (40.54 %)	Method: Urinalysis Definition: Dichotomized cannabis use Timing: Baseline cannabis (first week) and cannabis as a time-dependent variable included in analyses	months  Method: Self-report or urinalysis; Definition: Dichotomo us; Participants dichotomiz ed as having used heroin during the period from week 2 through the 6- month follow-up assessment or not. Timing: 6 month follow-up	Cox proportion al hazards regression	$\chi^2$ =8.39, p<0.004., such that bas eline cannabis use significantly increased the risk of a lapse to heroin. $\chi^2$ =7.62, p<0.006, such that cannabis as a time-dependent variable significantly increased the risk of a lapse to heroin. <b>6-month follow-up:</b> $\chi^2$ =7.90, p<0.005, such that such that bas eline cannabis use significantly increased the risk of a lapse to
							heroin
Zielinski, 2017 (12)	Canad	Cross- sectional	777 (46.7% )	Method: MAP Definition: Dichotomized cannabis use in the past 30 days Timing: Baseline cannabis	Method: Urinalysis Definition: Dichotomo us; participants with any positive screens of illicit opioids Timing: 3 month testing period	Multivaria ble logistic regression analysis	OR: 1.16, 95%CI: 0.77, 1.75, p=0.49

Notes: "Dichotomized cannabis use" means users vs. non-users or at least one positive urine screen vs. none unless otherwise specified. MAP: Maudsley Addiction Profile; HR: hazard ratio; ANOVA: analysis of variance; RCT:

randomized controlled trial; ns: not significant; UDS: urine drug screen; MMT: methadone maintenance treatment; ANCOVA: analysis of covariance; OR: odds ratio. \*Proctor et al. (2016) had too many results to present in this table, so we included only intake cannabis values in relation to opioid use at all time points. See study for more results.

## **B.** Treatment Retention

Study	Countr	Study Design	Sample	Cannabis	Outcome	Statistical	Results
	У		size (%	Measuremen		Analysis	
			female)	t			
Epstein, 2003 (2)	USA	Secondary RCT analysis, 12 months	408 (40.44% )	Method: Diagnostic Interview and urinalysis Definition: Categorical; Non-users, occasional users and frequent users Timing: Time to dropout	Definition: Retention in clinical trials up till follow up Timing: Did they complete the follow ups to 12 months	Survival analysis for treatment retention for all 3 trials	In all 3 trials, p-values ranged from p=.69 to p=.72 Further statistics not reported.
Joe, 1998 (13)	USA	Prospective cohort, 360 days	981 (39%)	Method: Self-report Definition: Dichotomous; At least weekly marijuana use or not Timing: Baseline	Definition: Whether clients stayed at least 360 days in outpatient methadone treatment. Timing: 360 days into treatment	Hierarchica I linear regression model	b=0.13, SE=0.16, t=0.79, OR=1.14, ns
Levine, 2015 (3)	USA	Retros pectiv e cohort, 1 year	290 (40.34% )	Method: Urinalysis Definition: Dichotomized cannabis use Timing: Baseline within the First month of drug testing upon entry into MMT	Definition: Dichotomize dinto two groups:less than a year and more than a year Timing: 12 months after treatment	Logistic regression	Men: cannabis- negative: OR=5.00 (1.61-14.29), p=.01, such that less cannabis use predicted >1 year retention Women cannabis- negative: OR=9.09 (2.33-33.33),

							p<.001, such that less cannabis use predicted >1 year retention
Nava, 2007 (5)	Italy	Prospective cohort, 12 months	121 (13.22%)	Method: Self report, Urinalysis Definition: Dichotomous; long term users (more than 6 months) and currently smoking at least 7 times per week vs. non-users never exposed to marijuana smoking. Timing: Baseline	Definition: Percentage dropout from treatment measured Timing: 2 weeks, 3 months, and 12 months	Kaplain- Mei er survival analysis	No significant association (values not reported).
Peles, 2006 (14)	Israel	Prospective cohort, 11 years	492 (27.24% )	Method: Urinalysis Definition: Dichotomized cannabis use Timing: 13 months or month before dropout	Definition: Continuous; The number of days in clinic from first admission until the patient quit treatment or until the end of follow-up (11 years) Timing: 132 months	Fishers exact test	Cannabis use on admission: p=0.3, ns
Peles, 2008 (15)	USA and Israel	Prospective cohort, 12 months	794 (30.98% )	Method: Weekly urinalysis; Definition: Dichotomized cannabis use Timing: Baseline and	Definition: Continuous; Duration in clinic from first admission until the patient	Kaplan- Meier survival analysis with log rank for cumulative retention.	Tel Aviv: Positive THC on admission: log rank=0.2, p=.8 Positive THC after 1 year:

Saxon, 1996 (8)	USA	Prospective cohort, 18	353 (38.20%	in-treatment For follow-up, recorded cannabis use month after completion or one month before if early dropout  Method: Self report	stopped treatment or until the end of the follow- up Timing: Analyzed 6 months retention and 1 year retention in treatment  Definition: subjects	Cox	log rank=1.8, p=.2  Las Vegas: Positive THC on admission: log rank=4.2, p=.04 Positive THC after 1 year: log rank=0.8, p=.4 Included in multivariate analysis but not significant (values not provided) r=0.06; B=1.08 (0.97-
таар (8)		months	)	Definition: Categorical; seven-point scale ranging from 0 "never" to 6 "four or more times per day". Timing: 6 months prior to baseline	remaining in treatment continuously after enrol ment and those not remaining Timing: 18 months after enrol ment	analysis	1.2), ns
Scavone, 2013 (9)	USA	Retros pectiv e cohort, 9 months	91 (39.56% )	Method: Self-report, Urinalysis Definition: Dichotomized cannabis use Timing: Baseline (self-report) and In-treatment (urinalysis frominitial 9 months of MMT enrolment)	Definition: Mean number of patients dropped out Timing: 9 months into treatment	Pearson correlation, chi square	Unfavourable discharge status: $r(80)$ =.069, $p$ =.567, $ns$ Premature discharge status: $\chi^2$ = 3.009, $p$ =.222, $ns$

Schiff, 2007 (16)	Israel	Retros pectiv e cohort, 13 months	2,683 (14.07% )	Method: Urinalysis Definition: Dichotomized cannabis use Timing: Baseline and in-treatment; 13 months	Definition: Dichotomize d patients as 100% retention vs. lower Timing: 13 months into treatment	Logistic regression	OR=1.43 (1.15, 1.78), p<.001, such that there was a significant relationship between cannabis use
				into treatment			and increased retention.
Weizman , 2004 (17)	Israel	Prospective cohort, 12 months	283 (NR)	Method: Urinalysis Definition: Dichotomous; Cannabis abuse vs. not; First assessed the percentage of tests positive for a given month (first month and 12th month); second considered that is a patient tested positive for cannabis for any consecutive 3 months during the first year of MMT, was considered a potential cannabis abuser. SCID used to confirm or disconfirm cannabis abuse status.	Definition: Treatment tenure was calculated based upon the overall number of days patients remained in treatment; Continuous Timing: 12 months into treatment	Cox regression survival analysis	Non-CAs vs CAs, B=-0.17; SE=0.13; Wald=1.57, p=0.21; r=0.00; Exp(B)=0.84 Analysis with heroin, cocaine, and BZD abuse as covariates did not significantly change the results.

RCT: randomized controlled trial; SE: standard error; OR: odds ratio; ns: not significant; MMT: methadone maintenance treatment; THC: tetra hydrocannabinol; NR: not reported; SCID: Structured Clinical Interview for DSM disorders; CA: cannabis abuser.

C. Polydrug Use

C. Polydrug Use									
Study	Countr	Study Design	Sample size (% female)	Cannabis Measureme nt	Outcome	Statistical Analysis	Results		
Best, 1999 (1)	∪K	Cross sectional	200 (30%)	Method: MAP Definition: Classified participants as daily users, occasional users, and non-users; categorical Timing: Baseline	Method: MAP Definition: Measured alcohol and crack cocaine use; continuous Timing: 30 days after MAP	ANOVA; post-hoc Scheffe test	Alcohol: F=5.24, p<.01 Scheffe test: significant difference such that non-users of cannabis consumed more alcohol than occasional and daily users Crack cocaine: F=4.67, p<.05 Scheffe test: significant difference such that non-users of cannabis consumed more alcohol than occasional and daily users		
Bleich, 1999 (19)	Israel	Prospective cohort, 12 months	148 (29.82 %)	Method: Urinalysis Definition: A positive urine test for cannabis. A drug abuser for any substance of abuse was defined as having a positive urine test for that substance during the 12th month of treatment. Timing: 12 months into treatment	Method: Urinalysis Definition: Benzodiazepines; A positive urine test for benzodiazepines non-abusers vs. abusers Timing: 12 months into treatment	Chi square	Benzodiazepin e: χ² = 7.77, p=0.005, such that benzodiazepine abusers were more likely to currently abuse cannabis that non abusers of benzodiazepine		

Epstein, 2003 (2)	USA	Secondary RCT analysis, 12 months	408 (40.44 %)	Method: Diagnostic Interview and urinalysis Definition: Categorical; Non-users, occasional users and frequent users Timing: Baseline and 12 months	Method: Urinalysis Definition: Continuous; Cocaine use from urinalysis Timing: Entire study duration	Multiple linear regressio n	Cocaine abstinence: Parameter estimate +/- SEM: 11.49 +/- 5.68, t=2.02, p=0.0438
Nirenber g, 1996 (6)	USA	Prospective cohort, 45 weeks	70 (1.43%)	Method: Urinalysis Definition: Dichotomous and Categorical; 4 groups: Group 1 - cannabis abstainers (Opositive screens); Group 2 - intermittent cannabis users (0%- 33.3% positive screens); Group 3 - moderate cannabis users (33.3% to 66.6% positive screens); Group 4 - consistent cannabis users (66.6%- 100% positive screens) Timing: 45 weeks	Method: Urinalysis Definition: Continuous; Cocaine and benzodiazepine use Timing: 45 weeks	ANOVA	F(3,66)=1.17, p=.33 such that there was no significant difference between the 4 cannabis groups and their use of cocaine.  Benzodiazepin es: F(3,66)=2.10, p=.11, such that there was no significant difference between the 4 cannabis groups and their use of benzodiazepine.

Peirce, 2009 (20)	USA	Secondary RCT analysis, 12 weeks	386 (44%)	Method: Urinalysis. breath sample Definition: Cannabis use defined as positive urine/breath sample given at study intake Timing: at intake Cannabis use disorder defined as the interview administere d checklist of DSM-IV substance use disorder symptoms	Method: Urinalysis, breath sample Definition: Stimulant use measured as number of stimulant- negative urine results provided Timing: Throughout the 12 week study intervention	Mixed- model regressio n	Cannabis use at intake: B(SE) = -3.27 (1.33), p=0.014, such that participants showed more stimulant use (less negative urine tests). Cannabis use disorder: B(SE) = 3.89(1.49), p=0.010, such that participants showed less stimulant use (more negative urine tests).
Saxon, 1996 (8)	USA	Prospective cohort, 18 months	353 (38.20 %)	Method: Self- reported seven-point scale ranging from 0 "never" to 6 "four or more times per day". Definition: Categorical; Timing: 6 months prior to baseline	Method: Urinalysis Definition: Continuous; percentage positive urine screens for any drug use then cocaine use, specifically Timing: 18 months in treatment	Cox regressio n model	Any drug use: Model 1:r=- 0.05; B=0.06 Not included in second model. Cocaine use: Model 1:r=- 0.08; B=-0.09 Model 2: B=- 0.11, p<0.05, such that pre- treatment frequency of cannabis use predicted less cocaine use
Saxon, 1993 (21)	USA	Cross sectional	98 (0%)	Method: Urinalysis; Definition: Dichotomize d cannabis use Timing: During the study period, specimens	Method: Urinalysis Definition: Continuous; screened for opiates, cocaine, and benzodiazepines. Timing: Weekly tests during entire treatment	Mann- Whitney U-test	THC+ vs. THC-: Percentage of urinalysis positive for other drugs of abuse was not significantly different between THC+ (median=6.5, mean

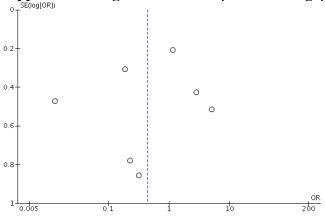

Scavone, 2013 (9)	USA	Retrospecti ve cohort, 9 months	91 (39.56 %)	were periodically tested for THC. The number of tests for THC per subject varied from 1 to 17 (median=4). THC testing was generally spread over the duration of the study so that subjects were tested periodically over a span of months.  Method: Self-report, Urinalysis Definition: Dichotomize d cannabis use Timing: Baseline (self-report) and Intreatment (urinalysis)	Method: Urinalysis Definition: Any illicit benzodiazepine use Timing: In- treatment (Initial 9 months of MMT enrol ment)	Correlation	rank=50.74) and THC- patients (median-6.3, mean rank=48.0; z=- 0.48).  Consistently THC+: Participants consistently THC+ had a smaller percentage of urinalysis positive for other drugs of abuse (median=3.25, mean rank=21.7) than those who were intermittently THC+ (median=8.2, mean rank=31.5; z=- 2.27, p<0.05).  Benzodiazepin e: r(91)=.374, p<.01, such that there was a positive correlation between rates of cannabis use and illicit benzodiazepine use during the initial nine
				(urinalysis from initial 9 months of MMT enrol ment)			months in treatment
Strain, 1991 (22)	USA	Cross sectional	66 (45%)	Method: Alcohol Research Center Intake Interview	Method: Alcohol Research Center Intake Interview Definition: Cocaine, sedative, and	Z-Test	Cocaine diagnosis: RR=0.69, ns Sedative diagnosis: RR=1.67, ns

# **Supplemental Figure S1.** Funnel plot evaluating publication bias for illicit opioid use $\sigma_{\tau}^{\text{SE}(\log[OR])}$

## Supplemental Figure S2. Funnel plot evaluating publication bias for treatment retention.

# **Supplemental Figure S3.** Illicit opioid use during treatment by cannabis use meta-analysis **A.** Meta-analysis forest plot for illicit opioid use

#### <u>Footnotes</u>

- (1) Combined results of two trials which were 8 weeks long
- (2) Results from one trial that was 12 weeks long
- (3) Prevalence reflects 12-month cannabis use, as baseline prevalence was not reported. Odds ratio reflects baseline cannabis use and 12-month opioid use.
- (4) Odds ratio as estimated in Epstein 2003

#### **B.** Subgroup meta-analysis stratified by measure of cannabis use

### Supplemental Figure S4. Treatment retention meta-analysis

#### A. Meta-analysis forest plot for treatment retention

#### **B.** Subgroup meta-analysis stratified by country

#### **Supplemental Statistical Methods:**

Many of the odds ratios necessary for the meta-analyses were not reported in the publications we've referenced. Here we document how the statistics were calculated.

#### Formula for Standard Error:

$$SE(\log(OR)) = \sqrt{\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d}}$$

a = cannabis positive AND opioid positive

b = cannabis negative AND opioid negative

c = cannabis positive AND opioid negative

d = cannabis negative AND opioid positive

#### Calculation for Epstein 2003a:

- Opiate study + Cocaine study #1
- State that rate of relapse is 80% in non-users of cannabis
- N cannabis users = 126 (frequent + non-frequent users in cocaine study 1 and opiate study)
- N non-cannabis users = 89
- 113 absent from illicit opioids

$$OR = 0.189$$
,  $SE = 0.307$ 

#### 2x2 Table

	+ opioids	- opioids	Total
+ cannabis	31	95	126
- cannabis	71	18	89
Total	102	113	215

### Calculation for Epstein 2003b:

- Cocaine study #2
- Rate of relapse is 90% in non-users
- N cannabis users = 94
- N non-cannabis users = 99
- 94 absent from illicit opioids in total

OR = 0.013376, SE = 0.4724

OR = a\*d/b\*c

100/7476 = 0.013376

	+ opioids	- opioids	Total
+ Cannabis	10	84	94
- Cannabis	89	10	99
Total	99	94	193

#### Calculation for Wasserman 1998:

- Information and relative risk calculation collected from Epstein et al., 2003
- 35 people tested positive for cannabis
- Sample size is 74
- Opioid positives detected in 30 patients
- N non-cannabis users = 39
- 44 absent from illicit opioids
- Relative risk is (21/35)/(9/36) = 2.6

OR = 5.00, SE = 0.5133
