This PDF file includes:

Figures S1 to S4
Tables S1 and S2

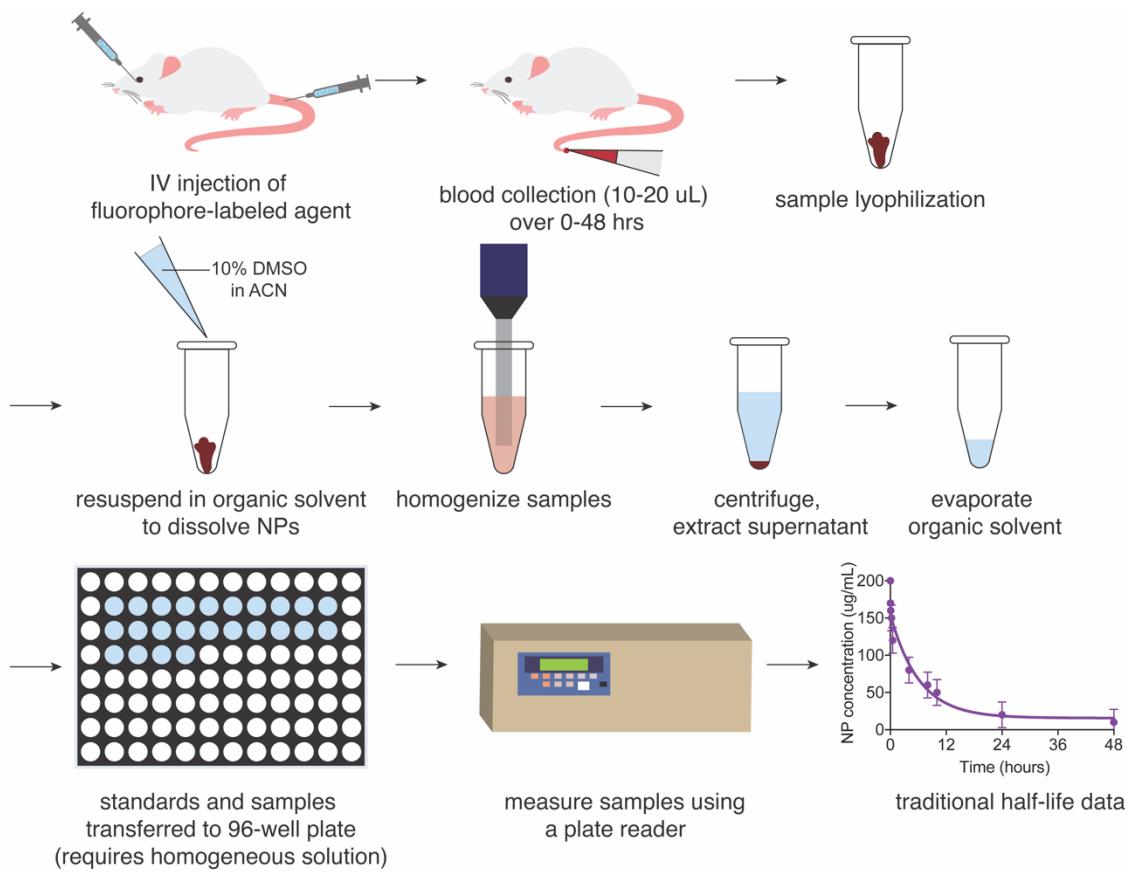

Fig. S1. Schematic illustrating the workflow for half-life measurements and end-point analyses using a traditional microplate method.

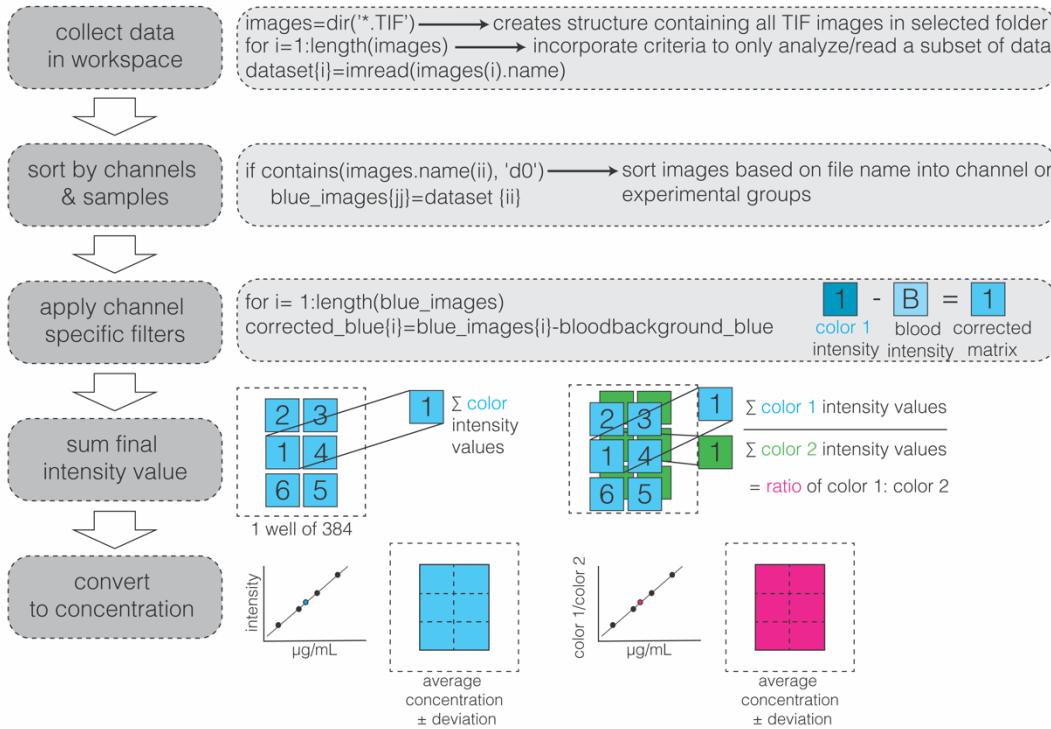

Fig. S2. MATLAB program workflow for quantitative image analysis.

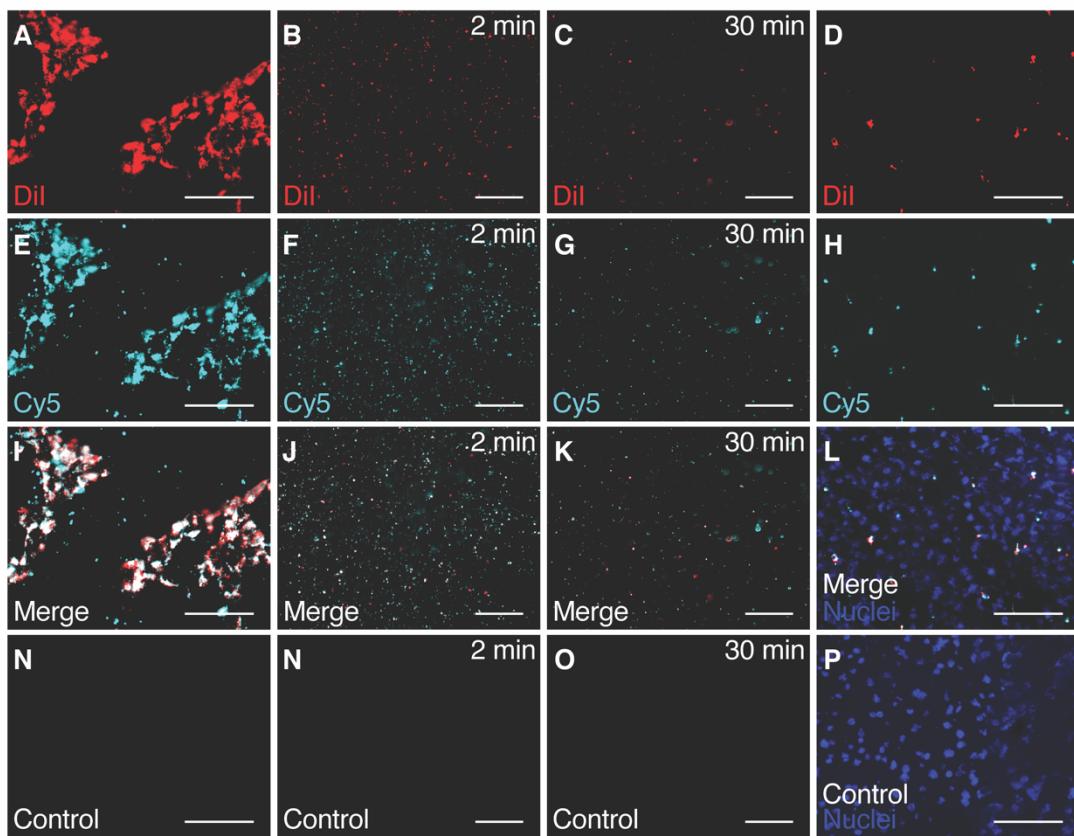

Fig. S3. Dual-color NPs demonstrate colocalization of polymeric vehicle and dye cargo.
 Representative fluorescence images of dual color NPs PLGA-Cy5 loaded with Dil administered *in vitro* in HEK293 cells and IV *in vivo*. (A-D) Dil signal in (A) HEK293 cells 24 hours after treatment, (B) blood collected 2 minutes after IV NP administration, (C) blood collected 30 minutes after IV NP administration, (D) liver sections 48 hours after IV NP administration. (E-H) Cy5 signal in the samples described in (A-D). (I-L) Merged Dil, Cy5, and Nuclei (where applicable) signal in the samples described in (A-D). (M-P) Merged Dil and Cy5 signal in control samples. Scale bars, 100 μ m.

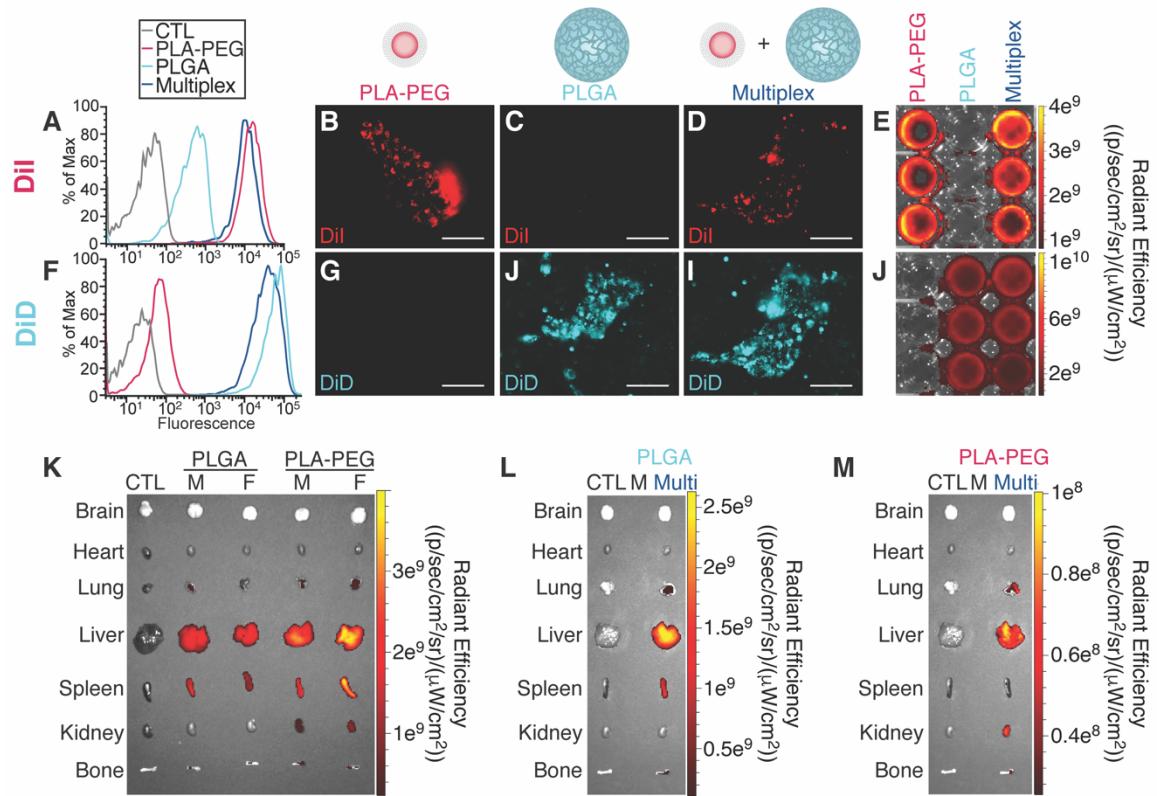

Fig. S4. Quantitative fluorescent measurements demonstrate feasibility of multiplexing. (A-J) Representative flow cytometry, microscopy, and IVIS data following treatment of HEK293 cells with Dil-loaded PLA-PEG, DiD-loaded PLGA, or combined Dil PLA-PEG and DiD PLGA NPs at 0.2 mg/mL. Panels (A-E) indicate signal obtained in the red channel (Dil signal). Panels (F-J) indicate signal obtained in the far red channel (DiD signal). Together, these data demonstrate that NP formulations encapsulating different fluorescent dyes can be distinguished from one another even when combined in the same experiment. (K-M) IVIS images of DiD or Dil NP-treated animals 48 hours after *in vivo* IV administration with untreated control animals. (K) DiD signal in the organs of male and female animals administered with DiD-loaded PLGA or PLA-PEG NPs. (L) DiD signal in the organs of a male animal administered with Dil-loaded PLA-PEG NPs and DiD-loaded PLGA NPs. (M) Dil signal in the organs of the animal in panel (L). Scale bars, 100 μm .

Table S1. Characterization data for dye-loaded PLA-PEG and PLGA NPs and the Anti-CD45 IgG1 antibody.

Agent	Diameter (nm)	Polydispersity Index (PDI)	Zeta Potential (mV)
PLA-PEG DiD	173 ± 1	0.140	-24.0 ± 0.9
PLA-PEG DiO	184 ± 5	0.140	-19.2 ± 0.6
PLA-PEG Dil	183 ± 1	0.150	-23.8 ± 0.5
PLGA DiD	273 ± 2	0.190	-17.2 ± 0.7
PLGA DiO	262 ± 2	0.140	-20.2 ± 0.6
PLGA-Cy5 Dil	339 ± 2	0.180	-19.2 ± 0.5
mouse-anti-human IgG1 antibody (anti-CD45)	~10 (150-170 kDa)	-	-

Table S2. NP concentration values calculated for each image ($n=6$) of each blood sample ($n=3$) per time point ($n=10$) following retro-orbital or tail-vein IV PLA-PEG NP administration.

Time	NP concentration ($\mu\text{g/mL}$)
