Table S1. Self-assembling Multidomain Peptides: peptide sequences and properties.

Name	Sequence	Monoisotopic mass (Da)	Molecular weight (Da)	Molar concentration of 1wt. % solution
K₂	Ac-KKSLSLSLSLSLK-CONH ₂	1772.103	1773.171	5.6 mM
E₂	Ac-EESLSLSLSLSLLEE-CONH ₂	1775.893	1776.937	5.6 mM
R₂	Ac-RRSLSLSLSLSLRR-CONH ₂	1885.225	1884.127	5.3 mM
D₂	Ac-DDSLSLSLSLSLDD-CONH ₂	1720.829	1719.83	5.8 mM

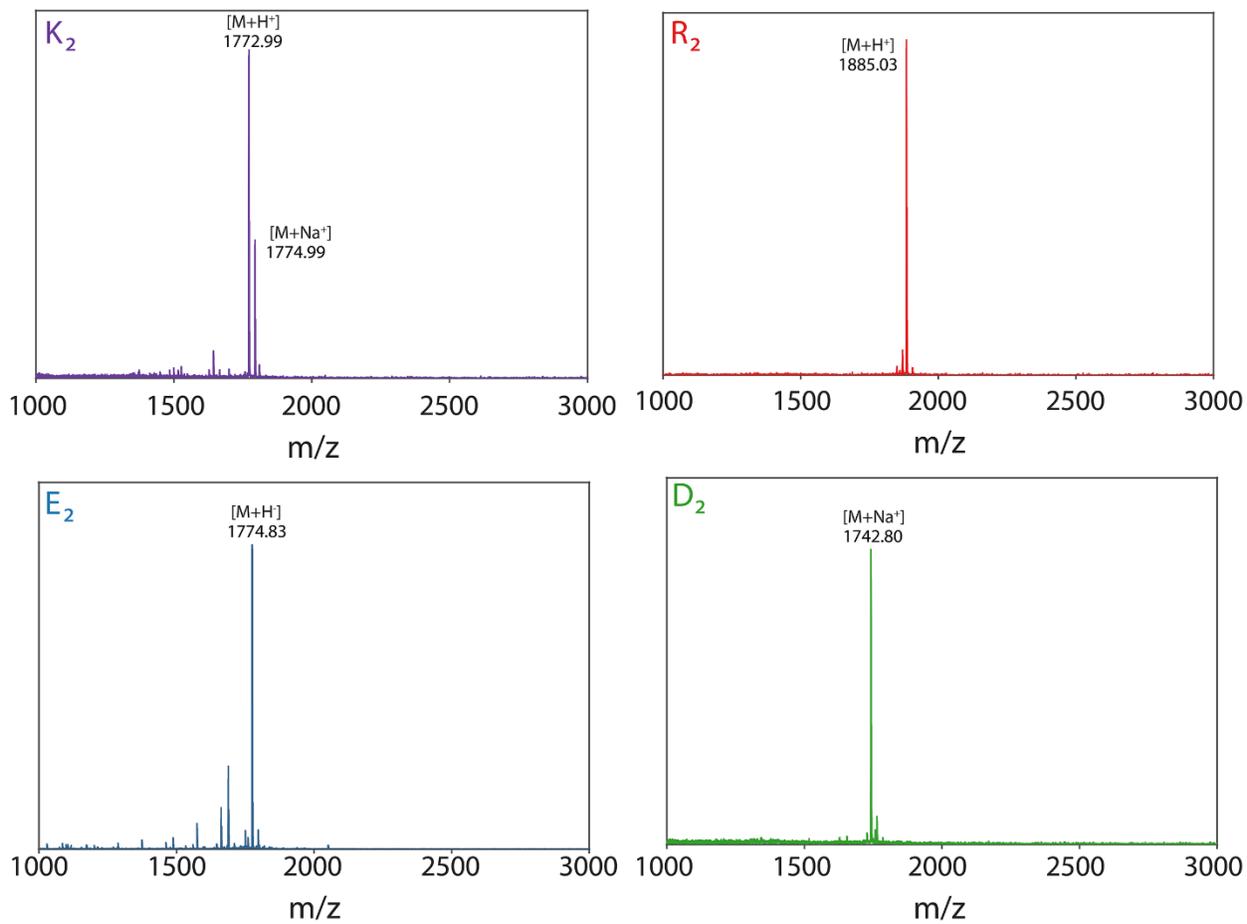

Figure S1. MALDI TOF MS spectra of the diverse multidomain peptides: K₂, R₂, E₂, D₂.

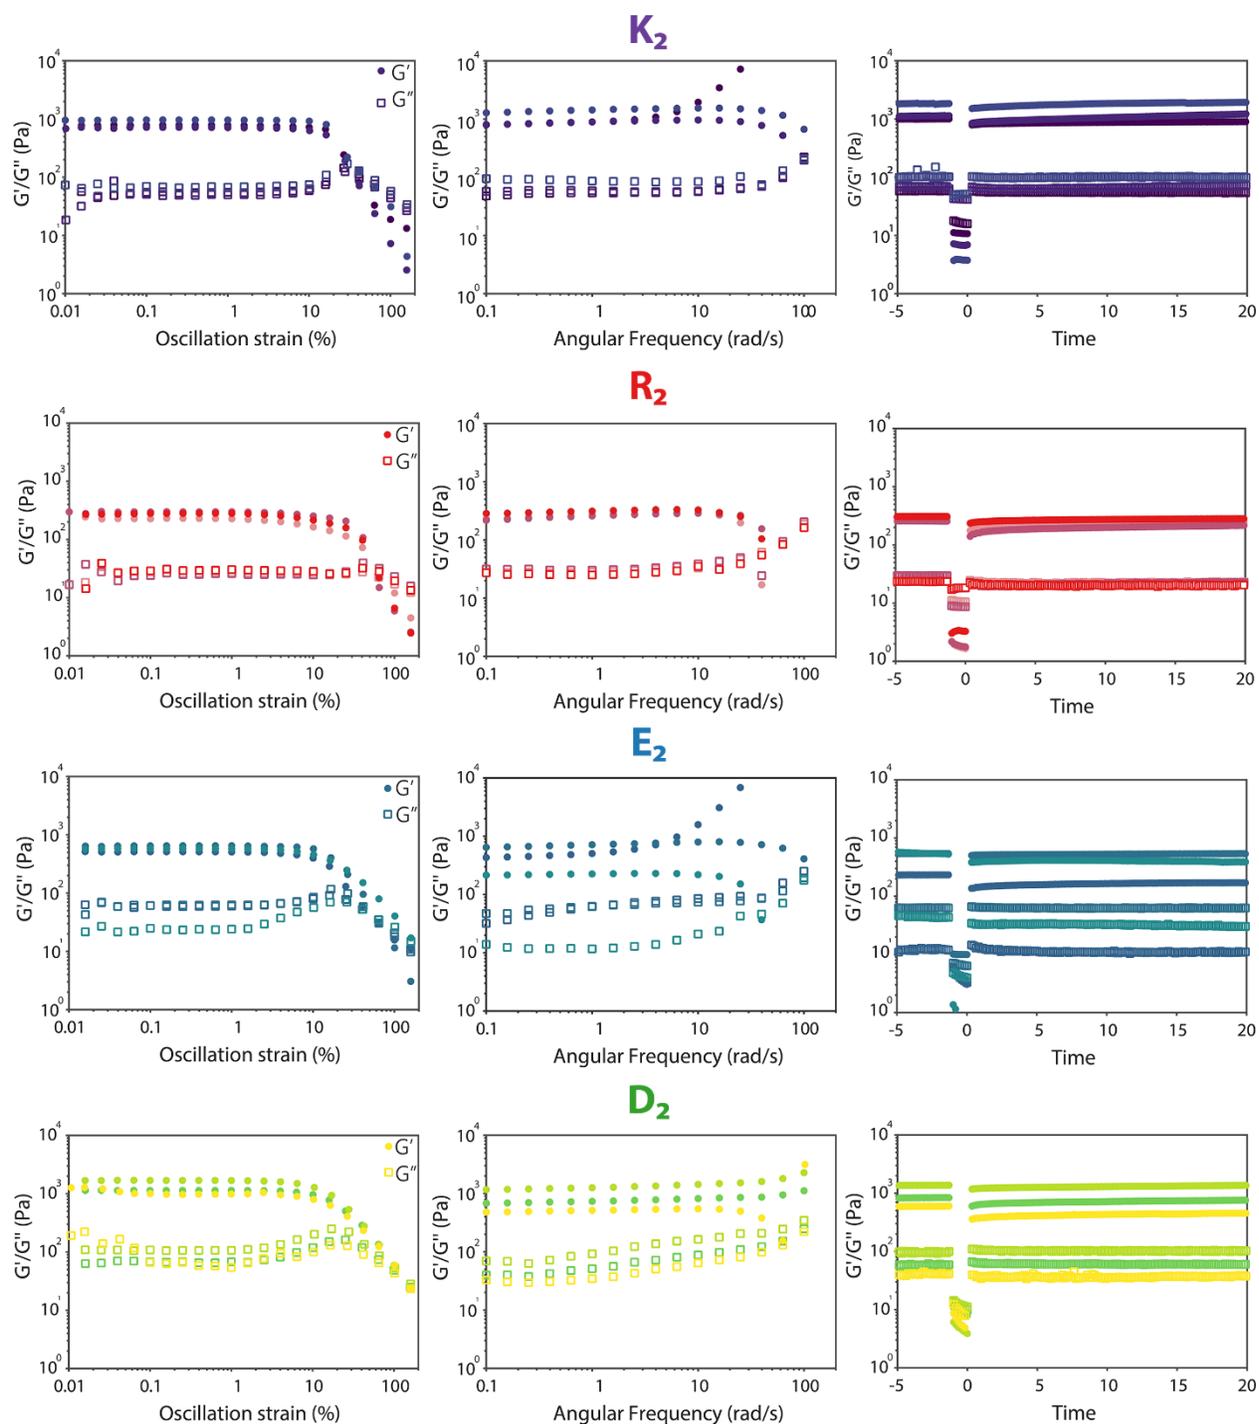

Figure S2. Viscoelastic properties of K₂, R₂, E₂, D₂ at 1% by weight in 149 mM sucrose 0.5X HBSS (amplitude sweep, frequency sweep and strain recovery). b) Storage and loss moduli of MDPs at 1% oscillatory strain. Peptide materials were analyzed in triplicate, all experimental results are shown in each plot.

Table S2. Peptide sequence and viscoelastic properties of Multidomain Peptides with different ionic domains. All peptides at 1% by weight in buffer form hydrogels that recover their viscoelastic properties after a shearing process.

Peptide	Sequence	G' (Pa)	G'' (Pa)	Shear Recovery (%)	
				1 min	20 min
K ₂	Ac-KKSLSLSLSLSLSLK-CONH ₂	819 ± 131	57 ± 9	82 ± 4	100 ± 9
R ₂	Ac-RRSLSLSLSLSLSLR- CONH ₂	269 ± 37	28 ± 2	71 ± 9	87 ± 4
E ₂	Ac-EESLSLSLSLSLEE-CONH ₂	579 ± 70	49 ± 22	77 ± 16	82 ± 15
D ₂	Ac-DDSLSLSLSLSLDD- CONH ₂	1271 ± 365	76 ± 27	81 ± 13	88 ± 12

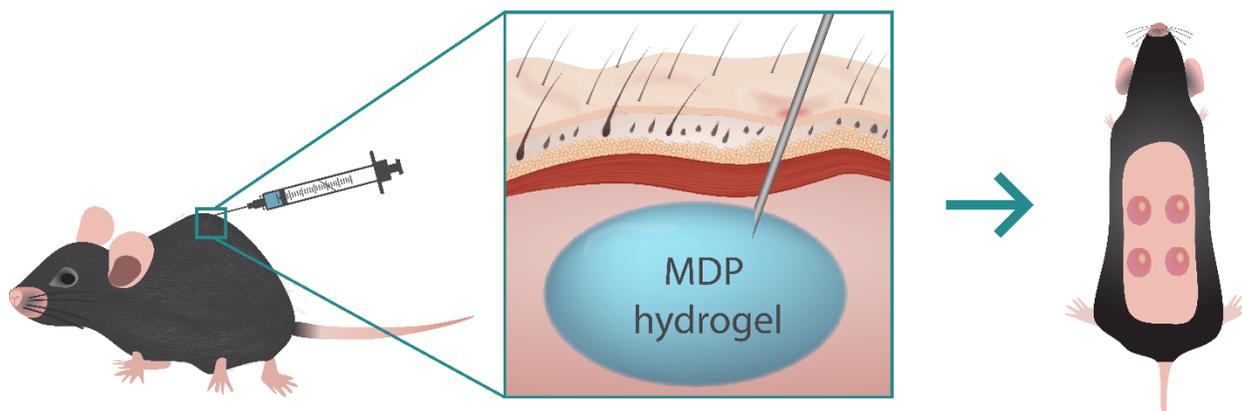

Figure S3. Subcutaneous injection model to evaluate the early host immune response to MDP hydrogels. Four injections of MDP hydrogel were distributed along the dorsal subcutaneous space.

Table S3. Immunophenotyping antibodies used for the flow cytometry panels.

	Live/dead		450/50

t-SNE clustering strategy

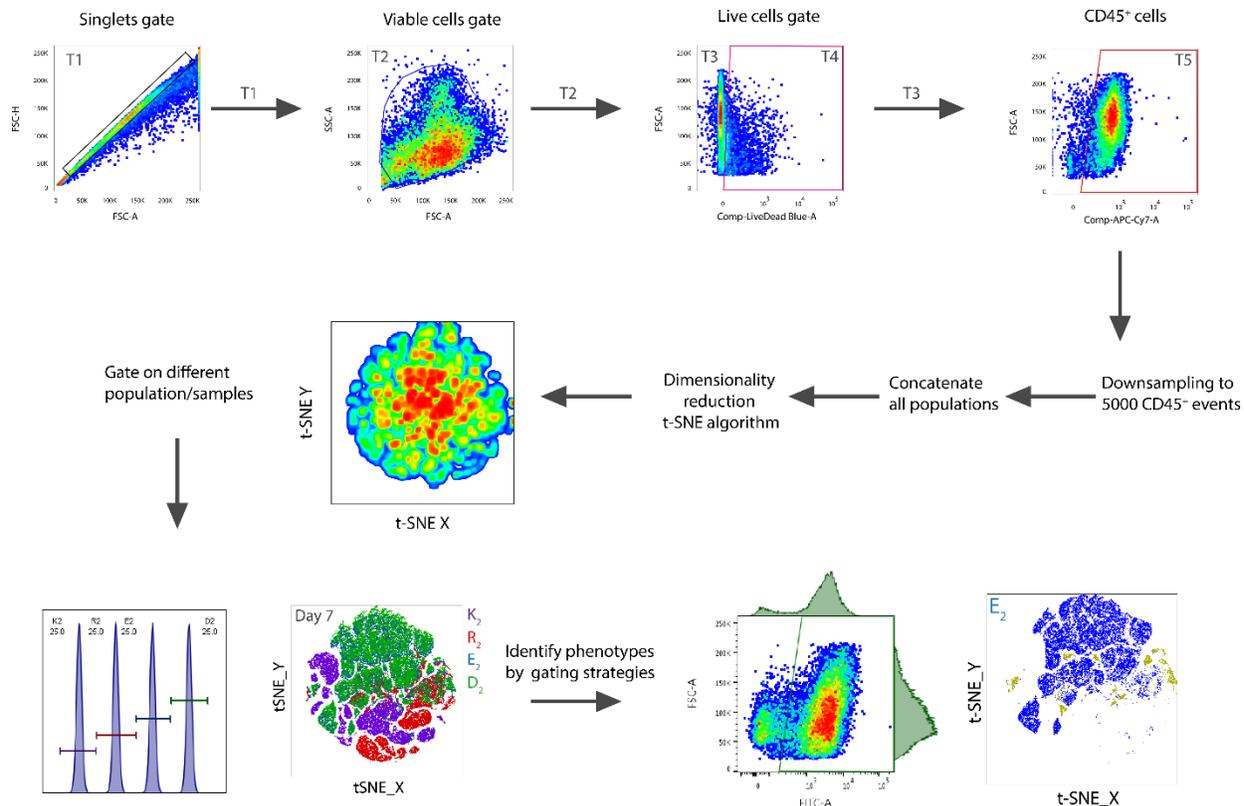

Figure S4. Gating strategy and t-SNE clustering method for flow cytometry data analysis. Singlets cells were gated from FSC-H vs FSC-A, followed by viable cells discrimination. Then live/dead gating was used to take live cells only and from them CD45+ immune cells were gated. All samples from each peptide or timepoint were downsampled to 5000 CD45 positive events and concatenated in a single FCS file. Dimensionality reduction by the t-SNE algorithm was performed using FlowJo v10 with the following parameters: 1000 iteration, perplexity value 30, eta value 200 and theta of 0.5. Clusters were gated according to the peptide or timepoint as well as phenotype using the myeloid strategy shown in Figure S18.

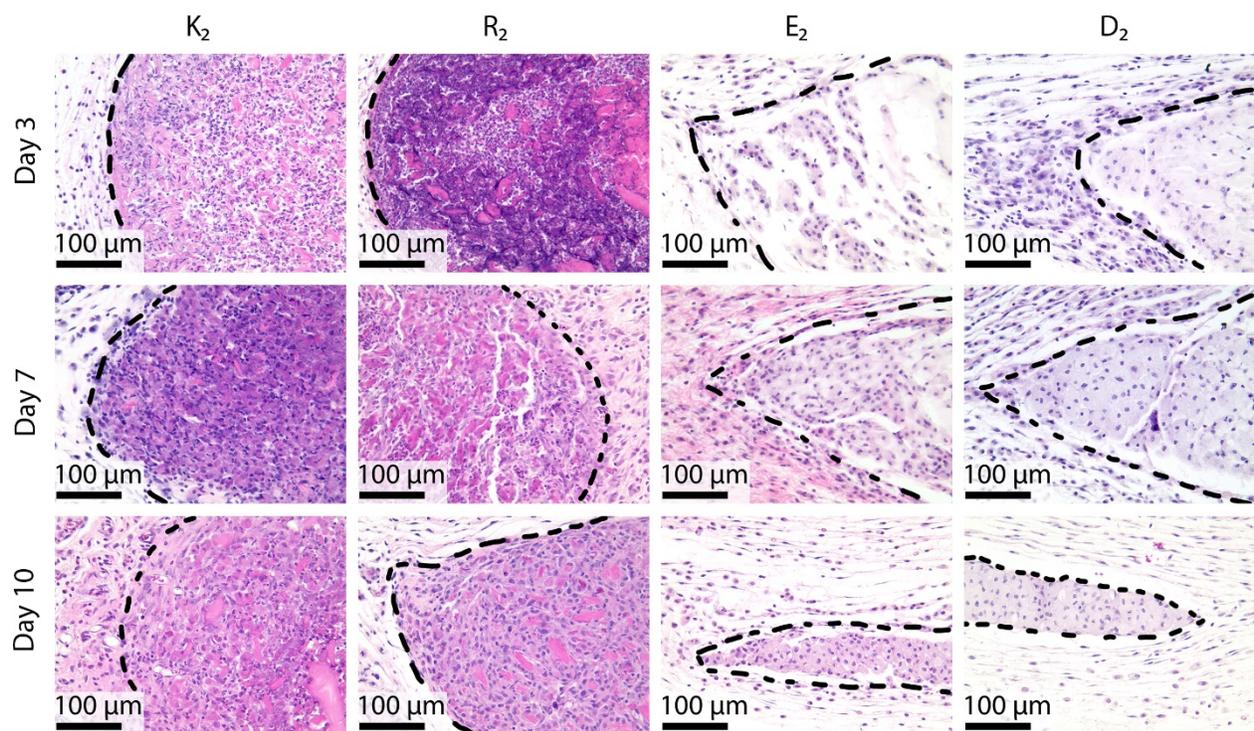

Figure S5. H&E staining of the implant edge of K₂, R₂, E₂, D₂ at day 3, 7 and 10 post-injection. Scale bar: 100 μm .

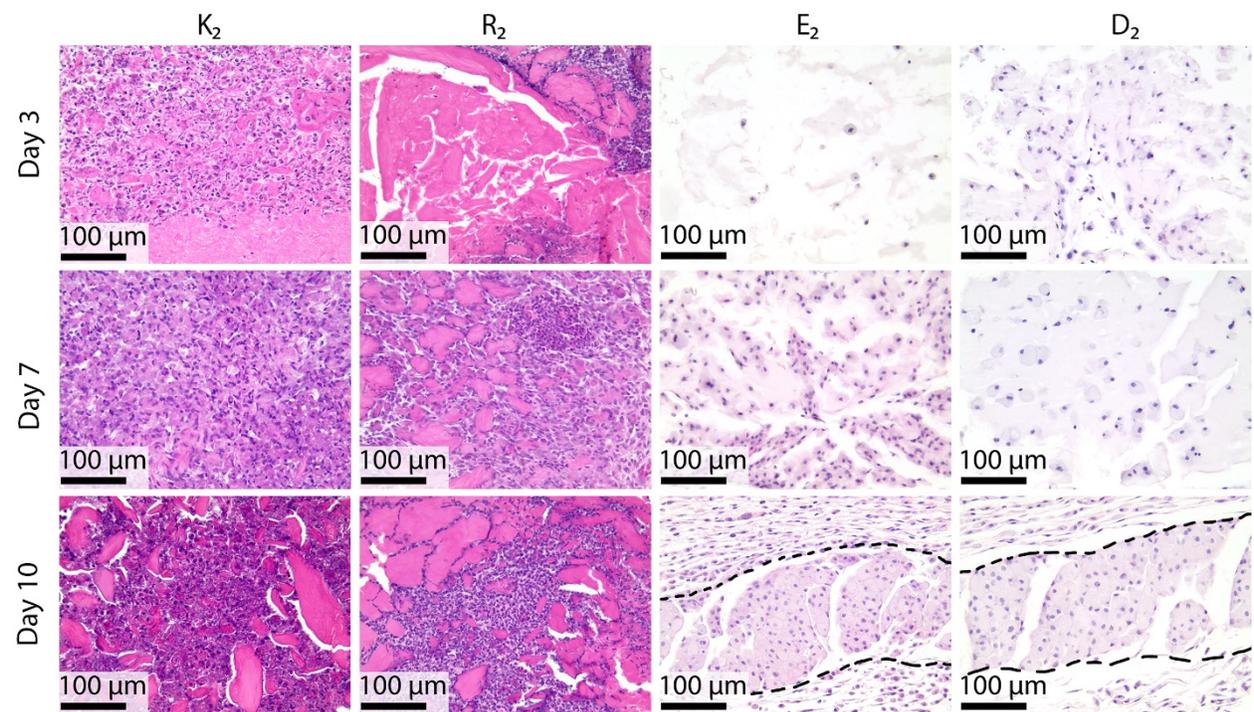

Figure S6. H&E staining of the implant core of K₂, R₂, E₂, D₂ at day 3, 7 and 10 post-injection. Scale bar: 100 μm .

Day 3 post-injection

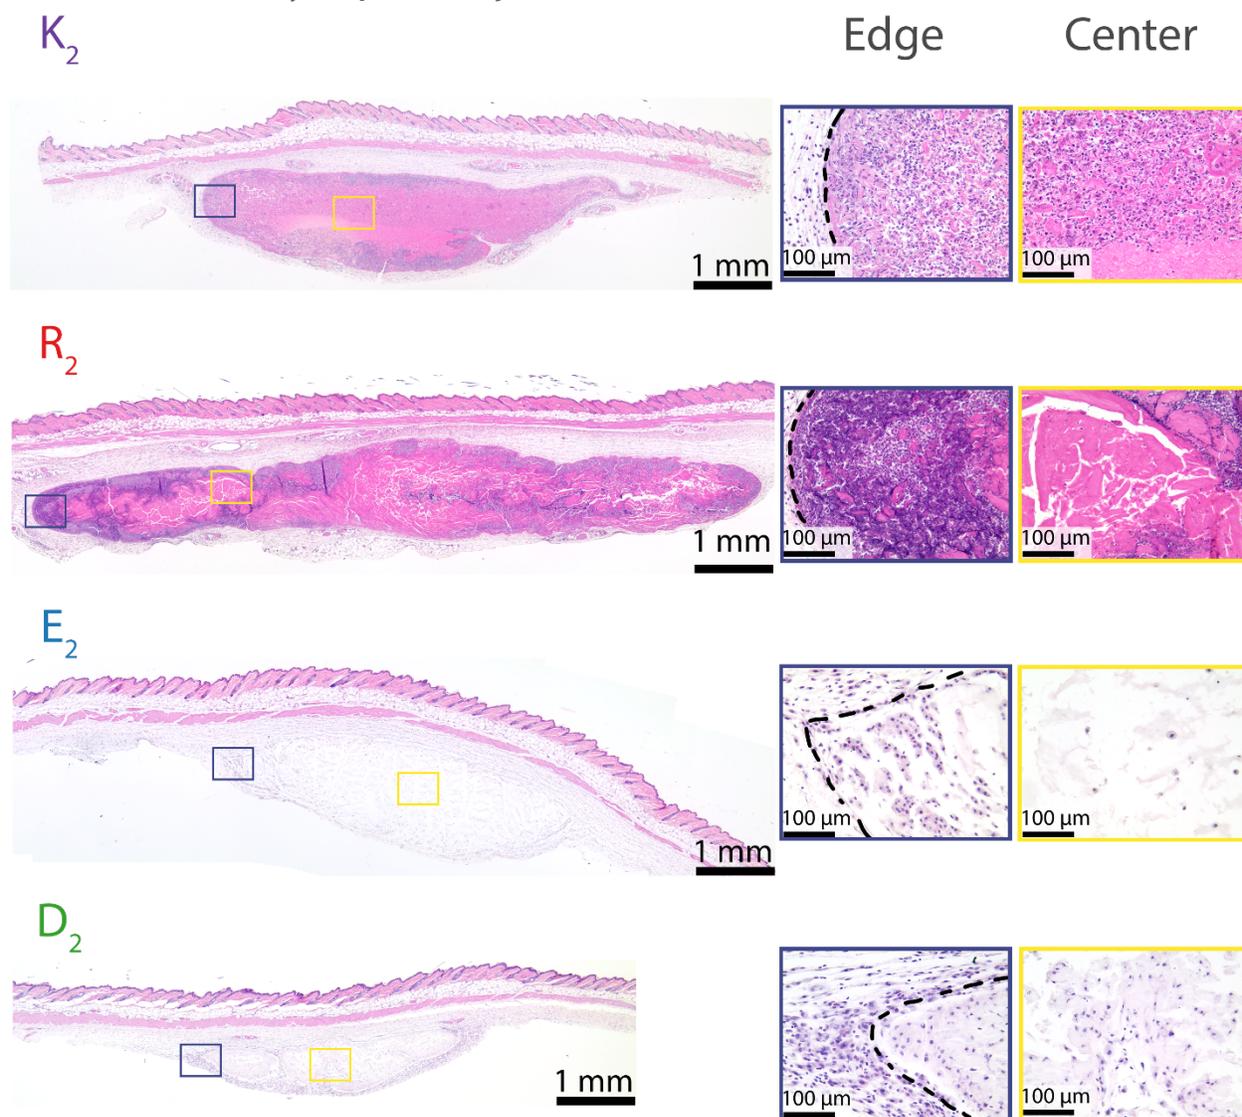

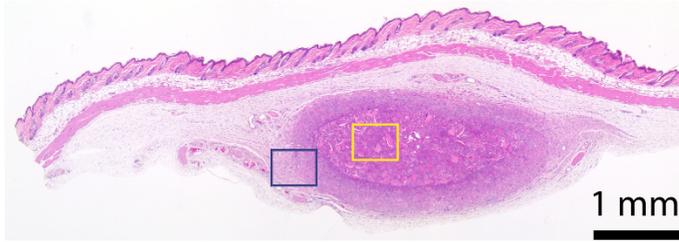

Figure S7. H&E staining of the whole implant of K_2 , R_2 , E_2 , D_2 at day 3 post-injection. the purple box represents the area of the implant edge. The yellow box represents the area of the implant center. Dash lines represent the hydrogel in the subcutaneous space. Scale bar: 1 mm.

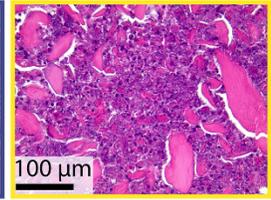

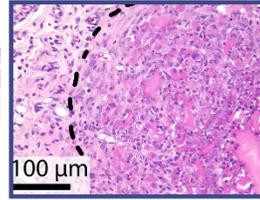

Day 10 post-injection

K_2

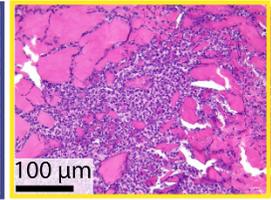

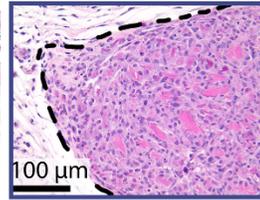

Edge

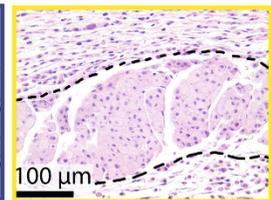

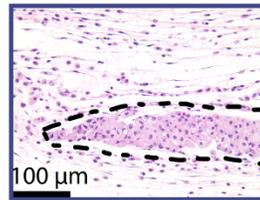

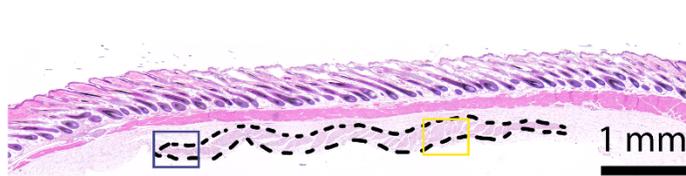

Center

R_2

E_2

D_2

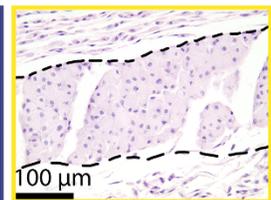

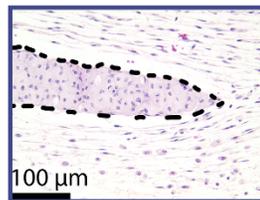

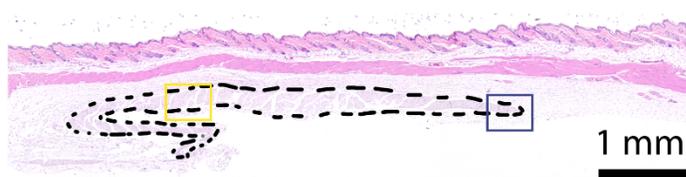

Figure S8. H&E staining of the whole implant of K_2 , R_2 , E_2 , D_2 at day 10 post-injection. The purple box represents the area of the implant edge. The yellow box represents the area of the implant center. Dash lines represent the hydrogel in the subcutaneous space. Scale bar: 1 mm.

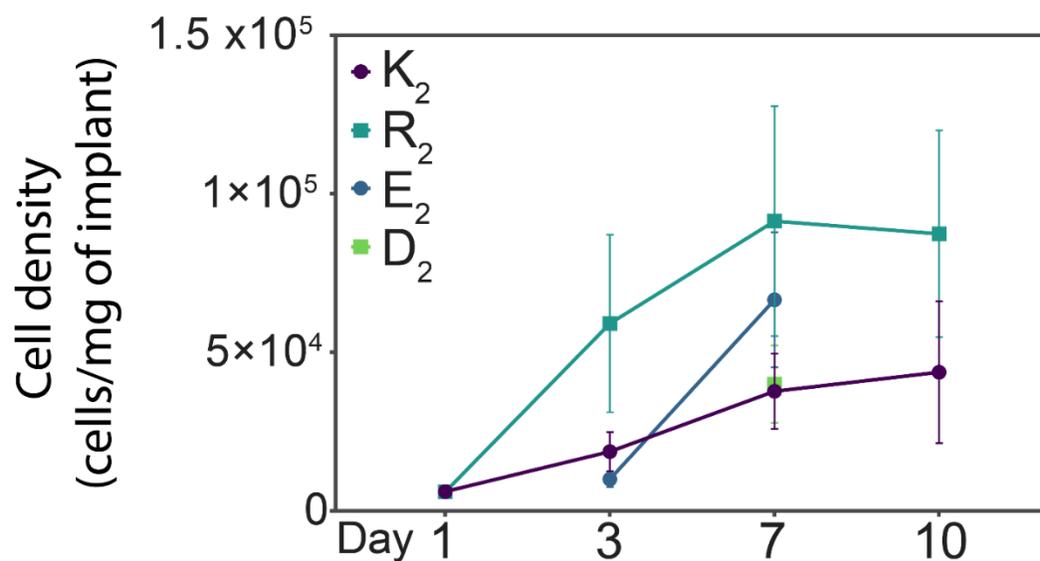

Figure S9. Cell density present in the MDP implants at different time points.

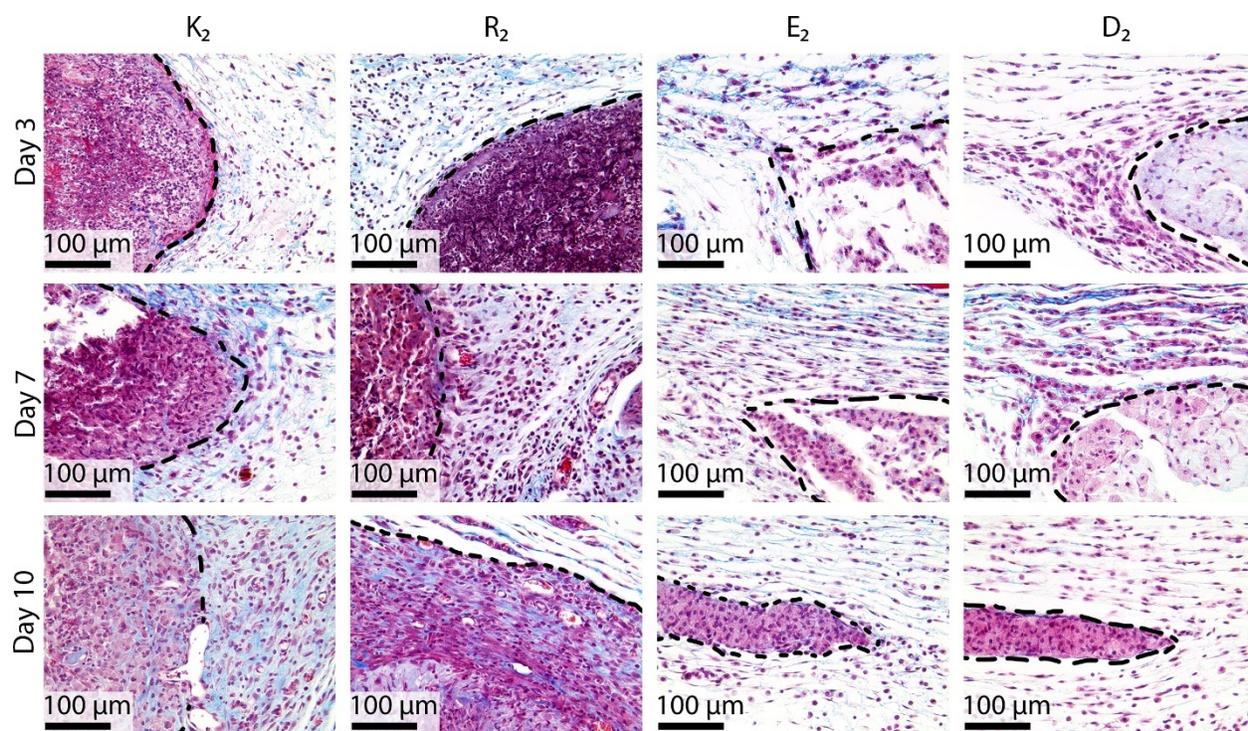

Figure S10. Collagen deposition and tissue remodeling of MDP hydrogel implants. Masson's Trichrome staining of implant cross-sections at day 3, 7 and 10 post-injection to observe collagen deposition in color blue. Images represent the interface between hydrogel and native tissue. By Day 10, K₂ and in particular R₂ show larger collagen deposition, whereas the negatively-charged MDPs have been degraded and remodeled into native tissue.

Day 3 post-injection

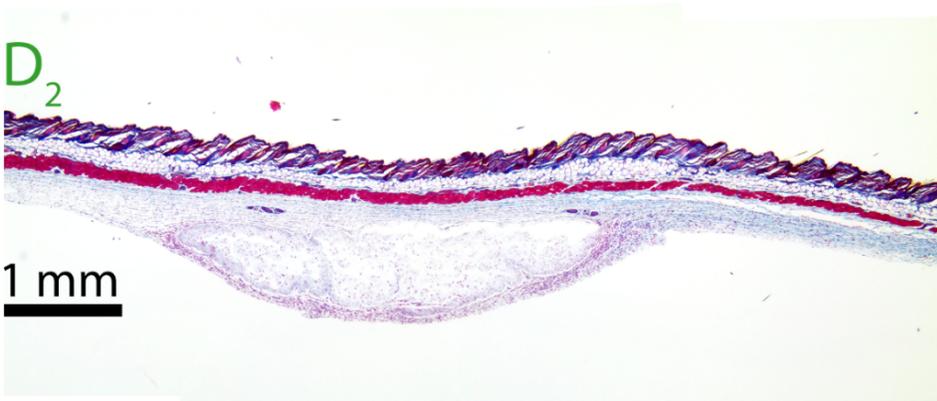

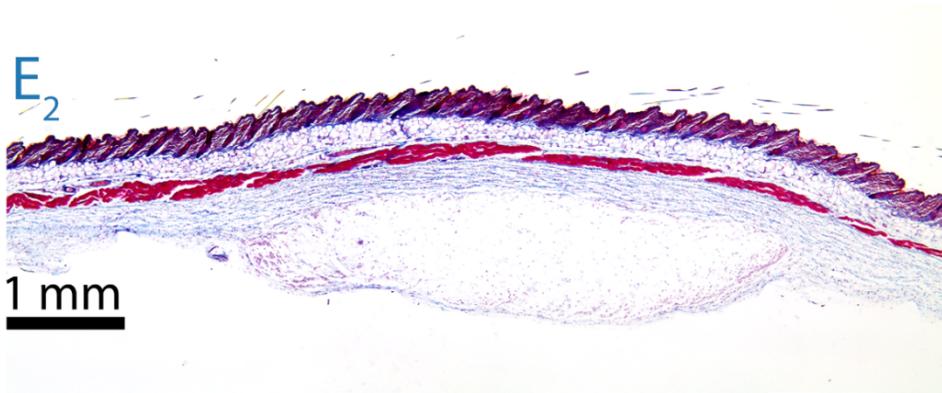

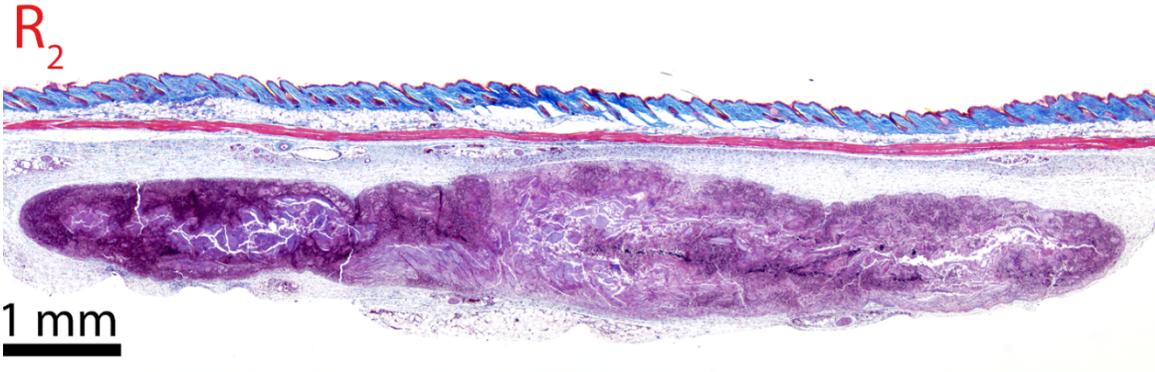

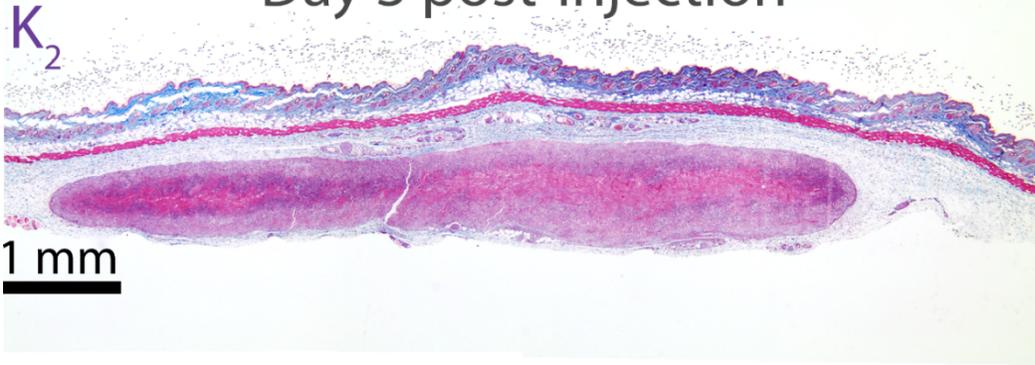

Figure S11. Masson's Trichrome staining of the whole implant of K_2 , R_2 , E_2 , D_2 at day 3 post-injection. Scale bar: 1 mm.

Day 7 post-injection

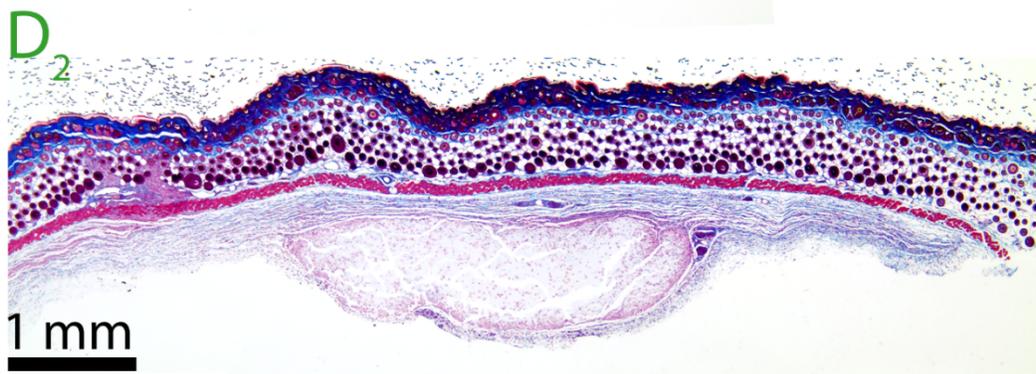

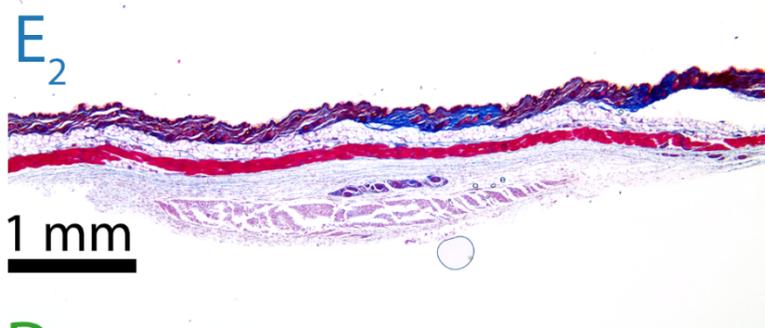

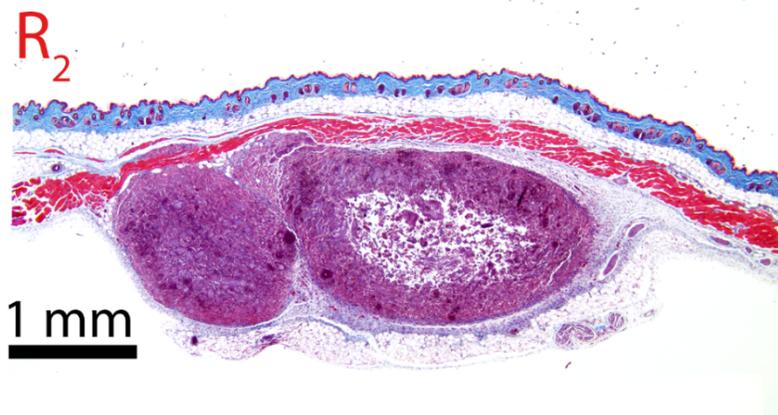

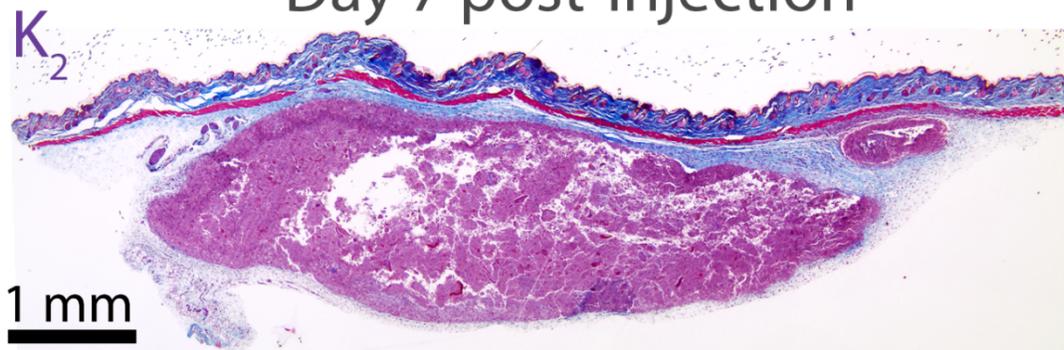

Figure S12. Masson's Trichrome staining of the whole implant of K₂, R₂, E₂, D₂ at day 7 post-injection. Scale bar: 1 mm.

Day 10 post-injection

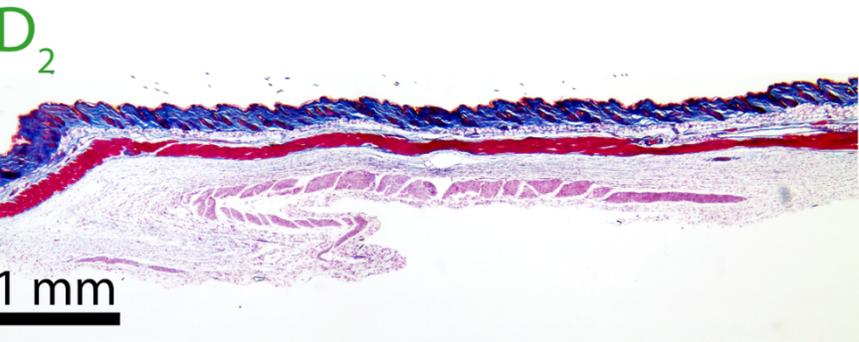

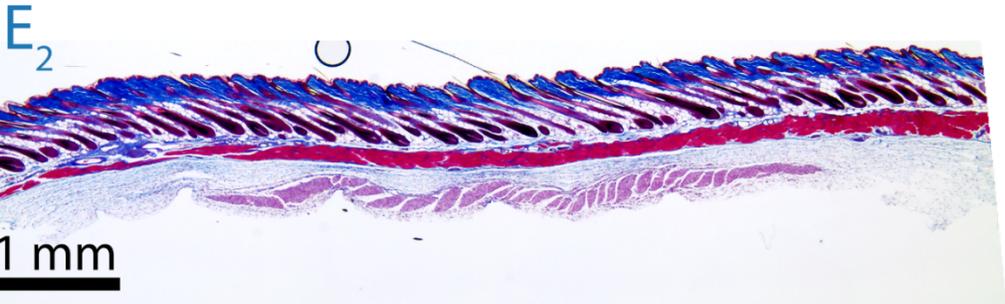

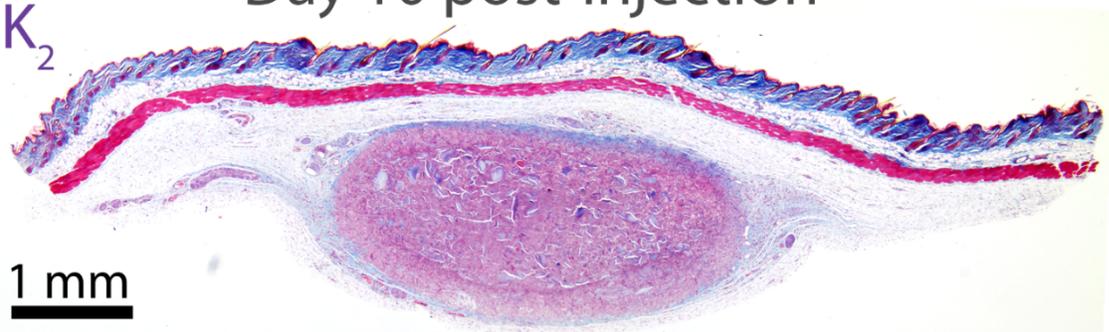

Figure S13. Masson's Trichrome staining of the whole implant of K₂, R₂, E₂, D₂ at day 10 post-injection. Scale bar: 1 mm.

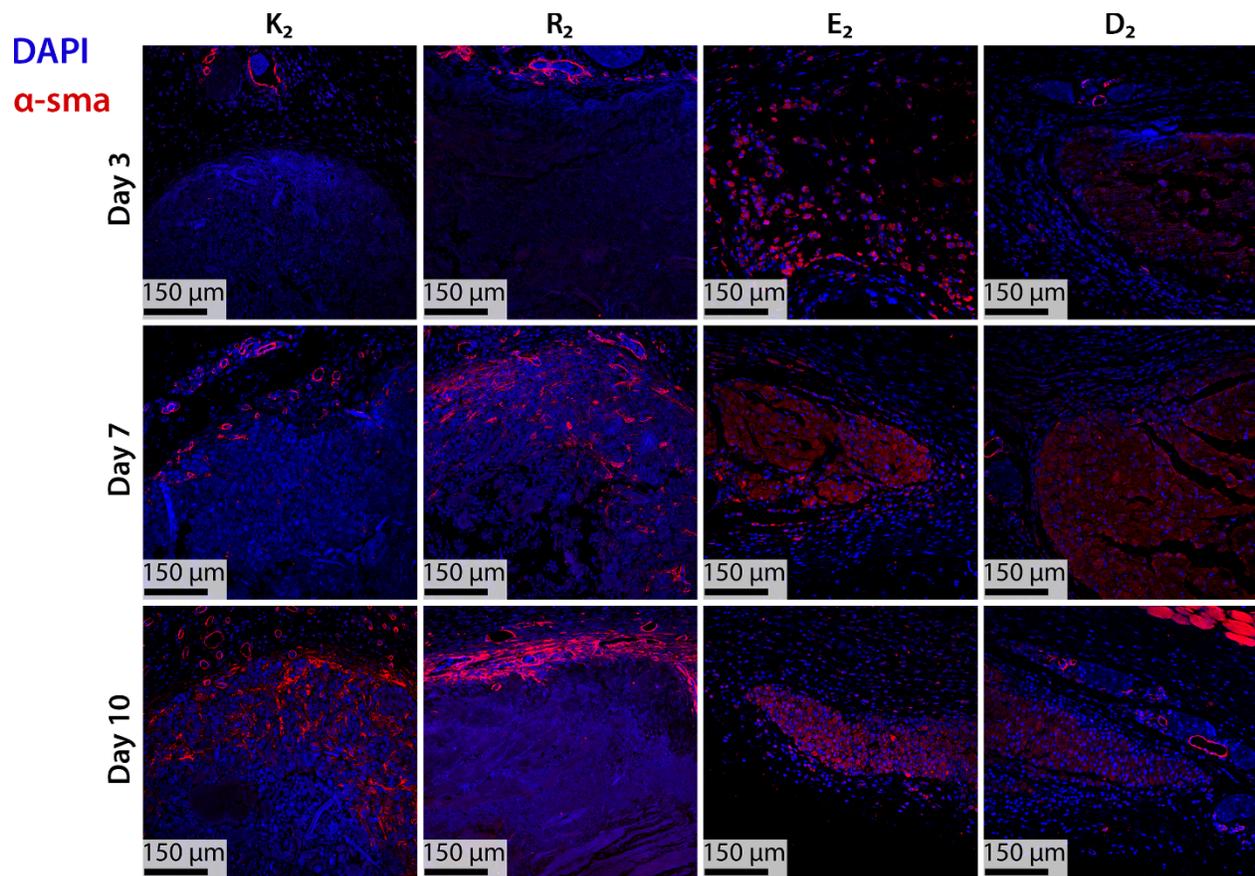

Figure S14. Immunostaining of alpha-smooth-muscle actin at the edge of the implants at day 3, 7 and 10 post-injection. Positive α -sma expression is shown in red and cell nuclei in blue (DAPI staining). Scale bar 150 μ m.

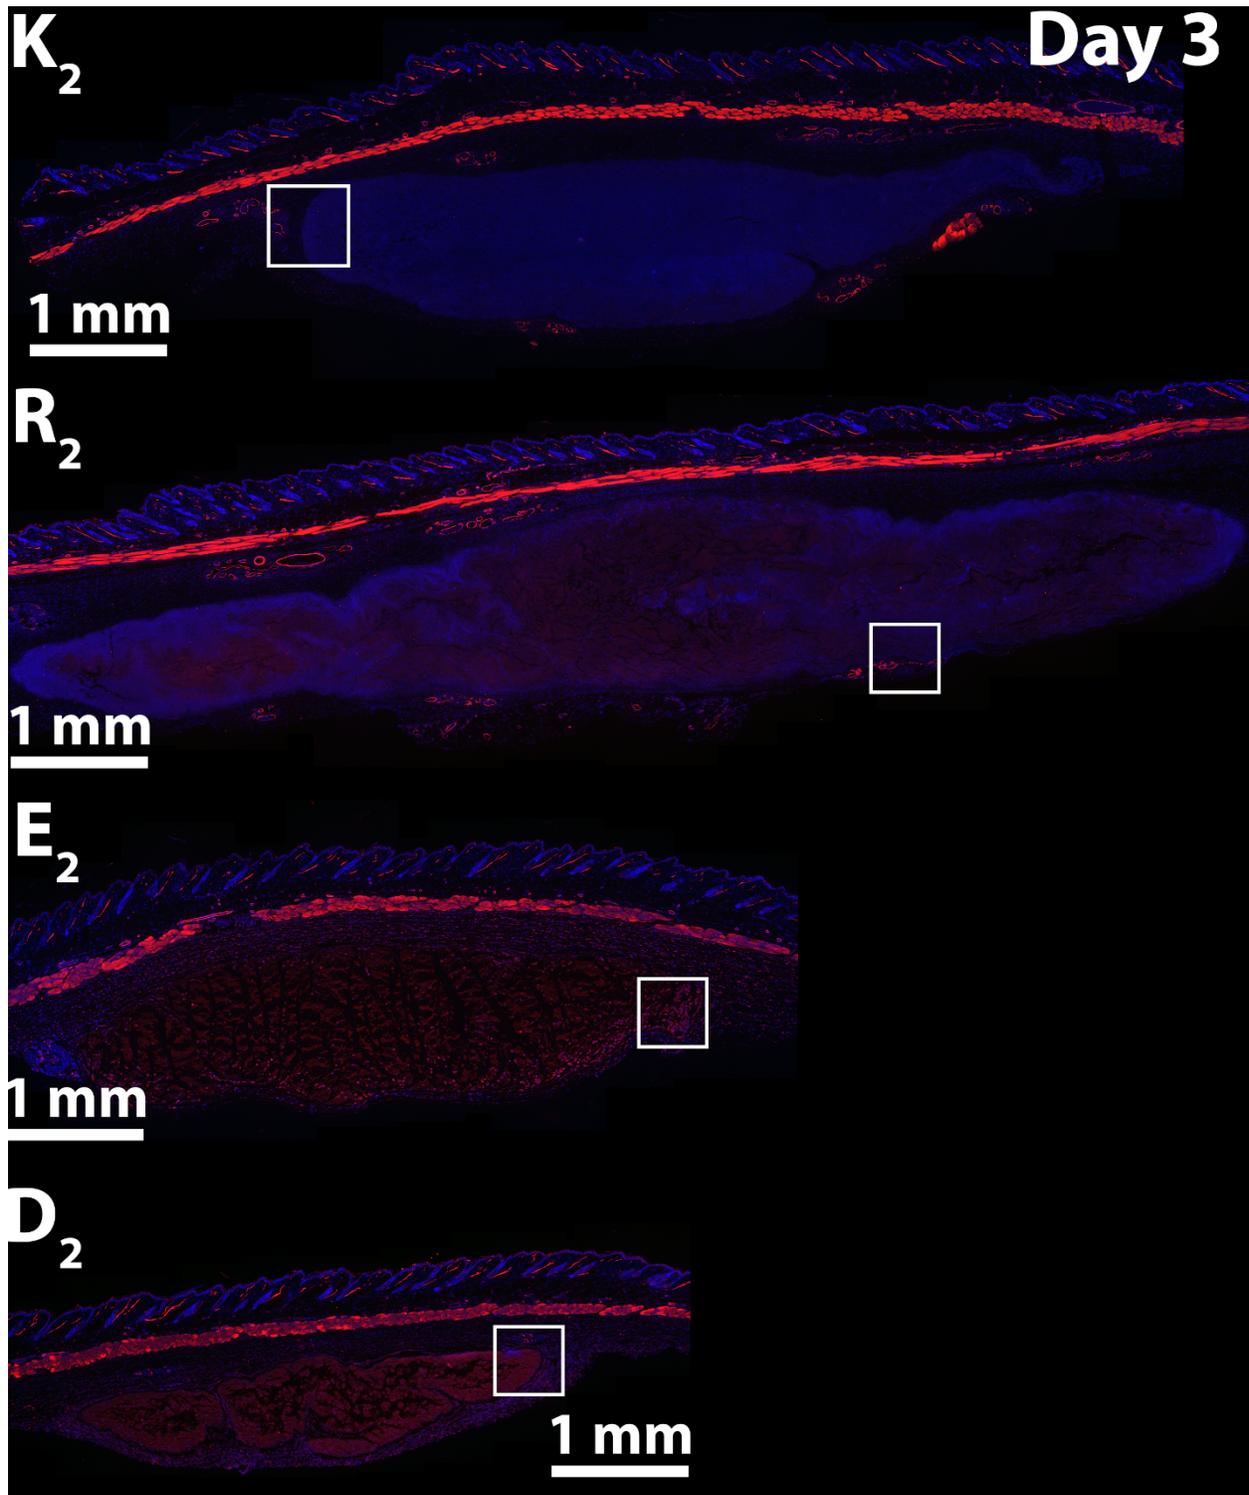

Figure S15. Immunostaining of alpha-smooth-muscle actin (red) and cell nuclei (blue) of the whole implant of K_2 , R_2 , E_2 , D_2 at day 3 post-injection. Scale bar: 1 mm.

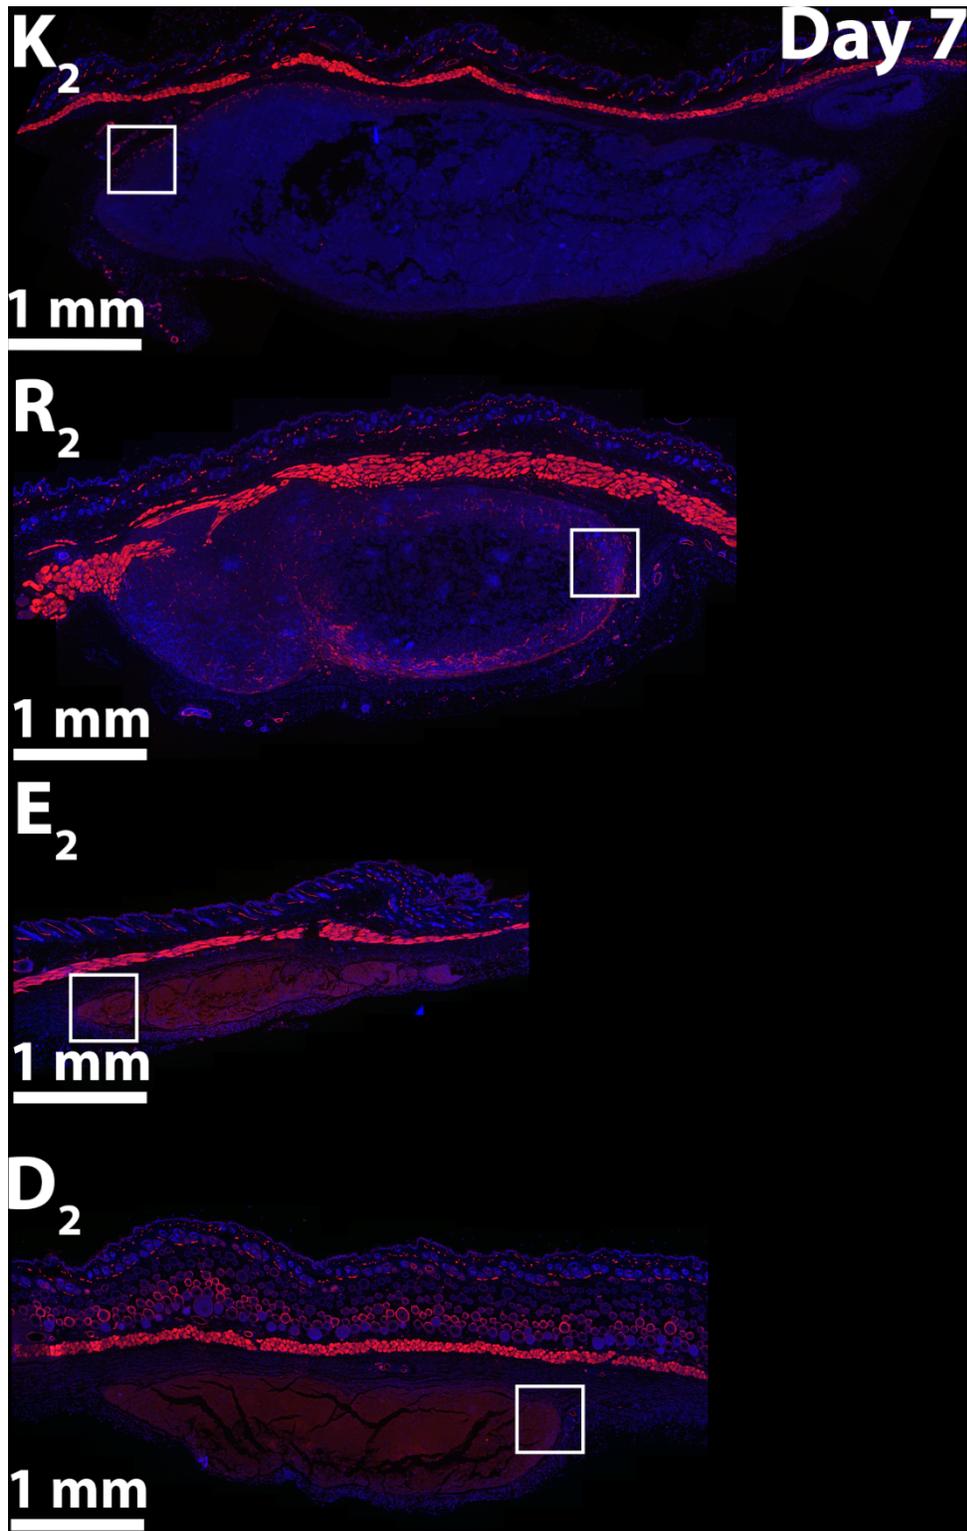

Figure S16. Immunostaining of alpha-smooth-muscle actin (red) and cell nuclei (blue) of the whole implant of K₂, R₂, E₂, D₂ at day 7 post-injection. Scale bar: 1 mm.

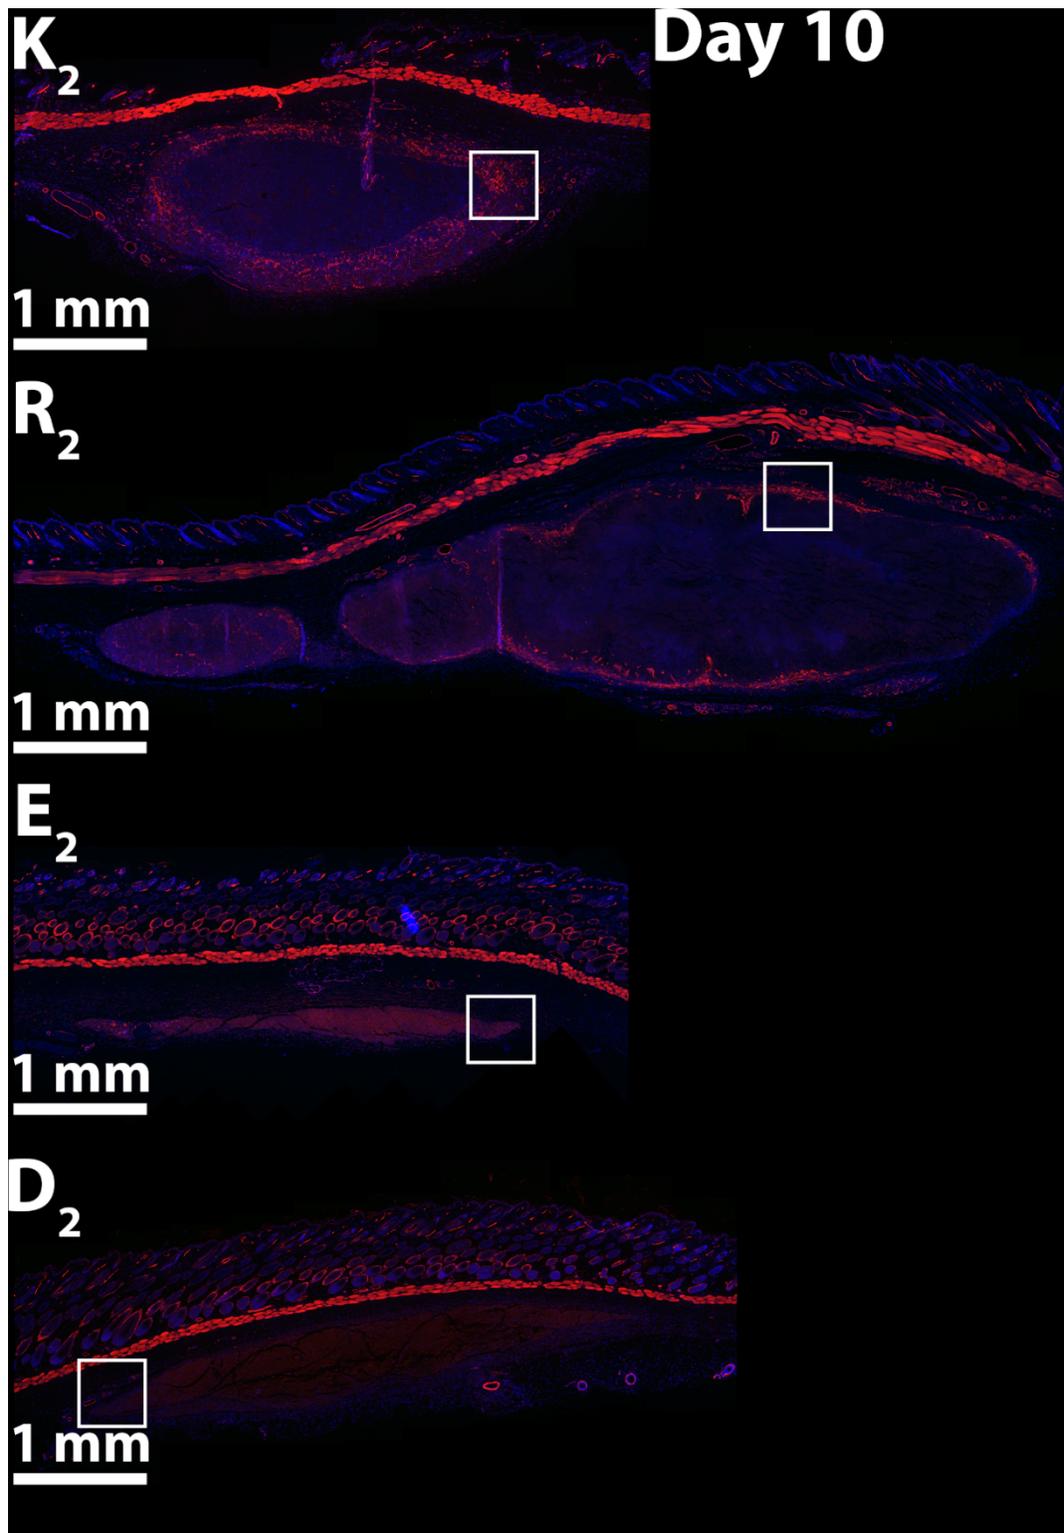

Figure S17. Immunostaining of alpha-smooth-muscle actin (red) and cell nuclei (blue) of the whole implant of K_2 , R_2 , E_2 , D_2 at day 10 post-injection. Scale bar: 1 mm.

Myeloid Panel Gating strategy

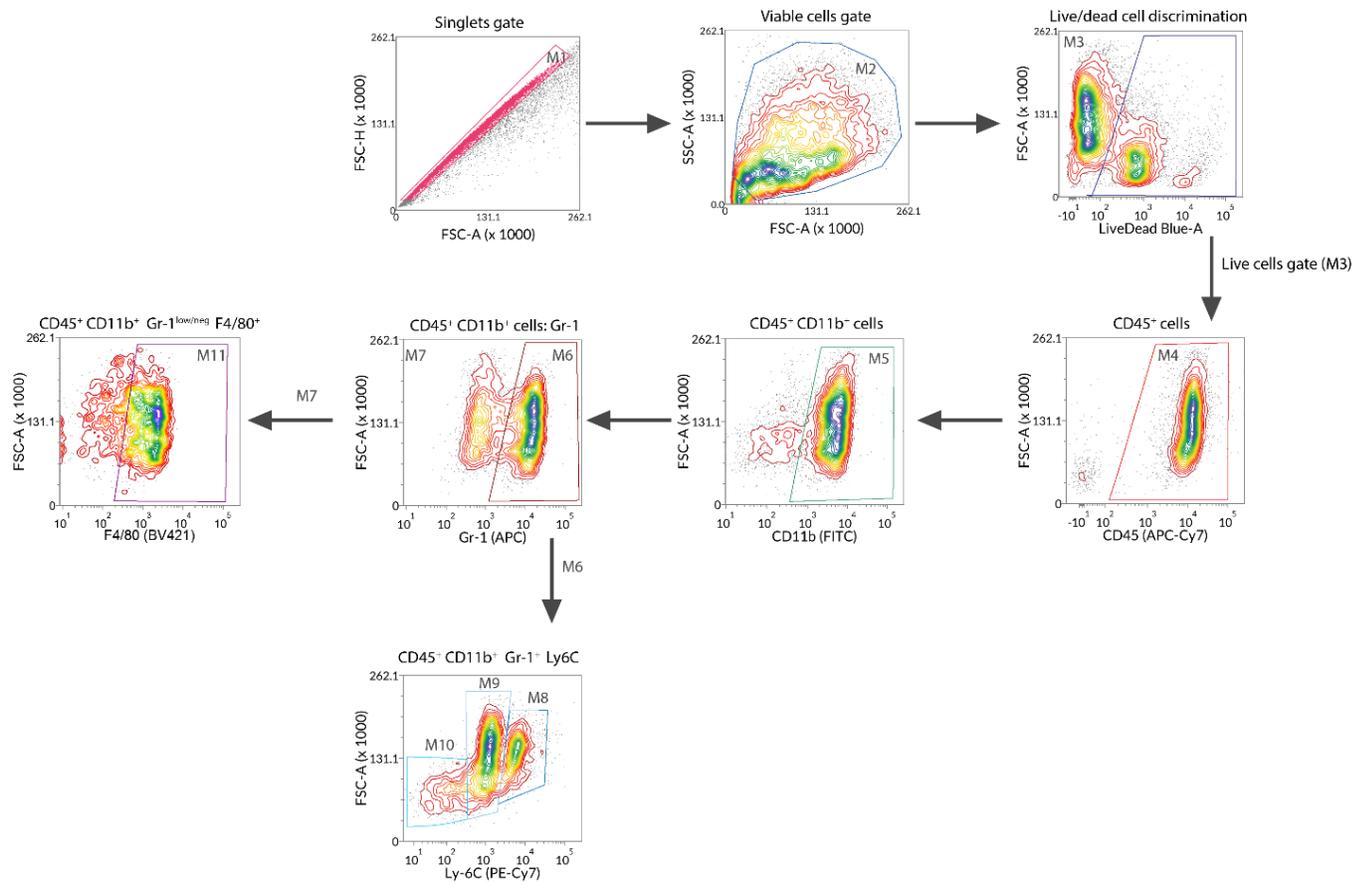

Figure S18. Gating strategy for the immunophenotyping of myeloid cells in the MDP hydrogels. M1 single cells after doubles discrimination (FSC-A vs FSC-H). M2 viable cells from M1. M3 Live cells after live/dead discrimination followed by immune CD45⁺ cell gating. Immune cells of myeloid origin (M5) were classified according to Gr-1, Ly6C and F4/80 expression (M6-M11).

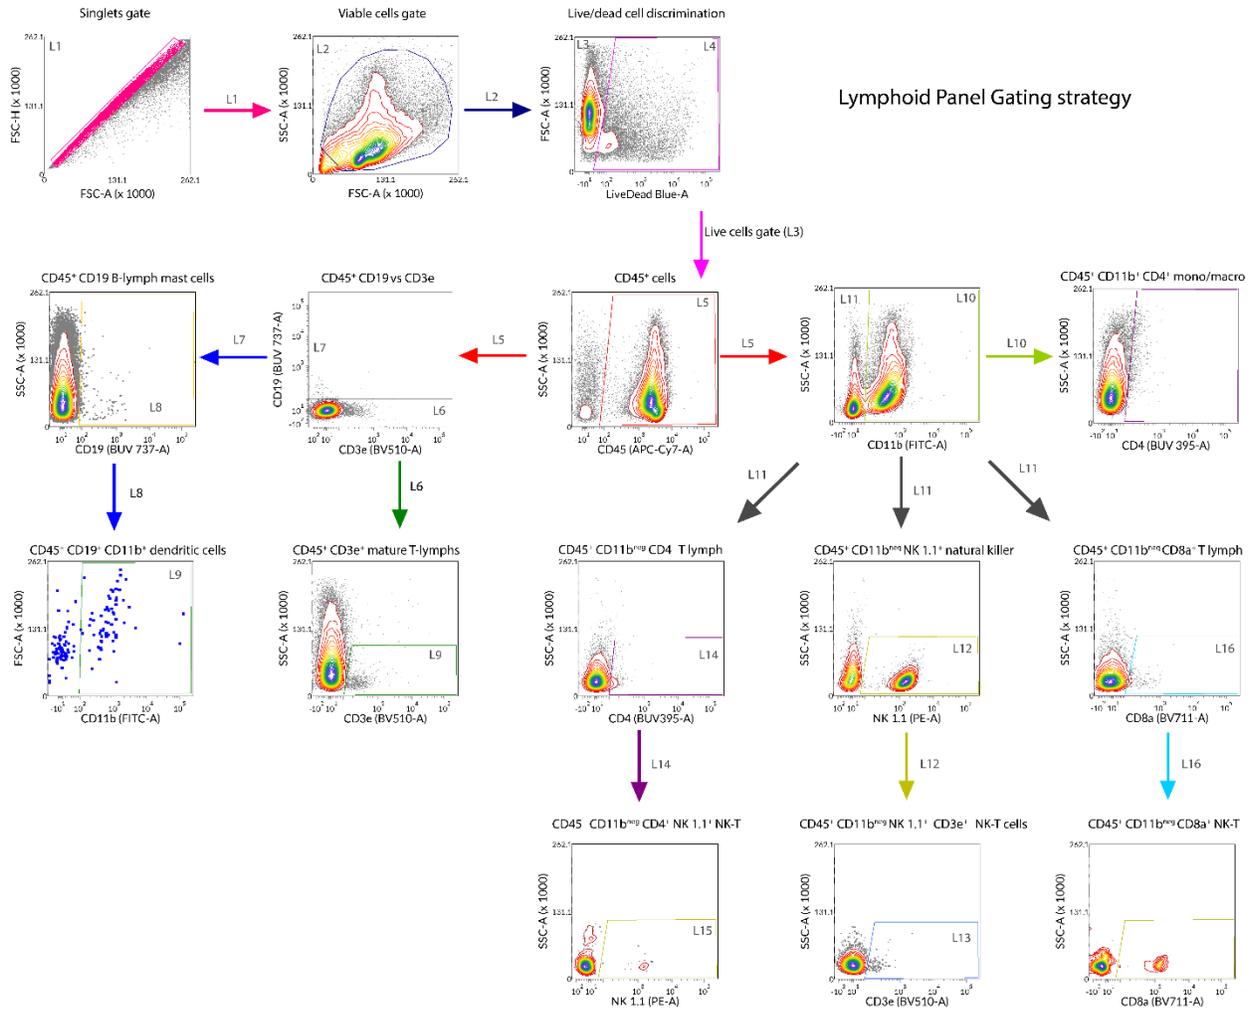

Figure S19. Gating strategy for the immunophenotyping of lymphoid cells in the MDP hydrogels.

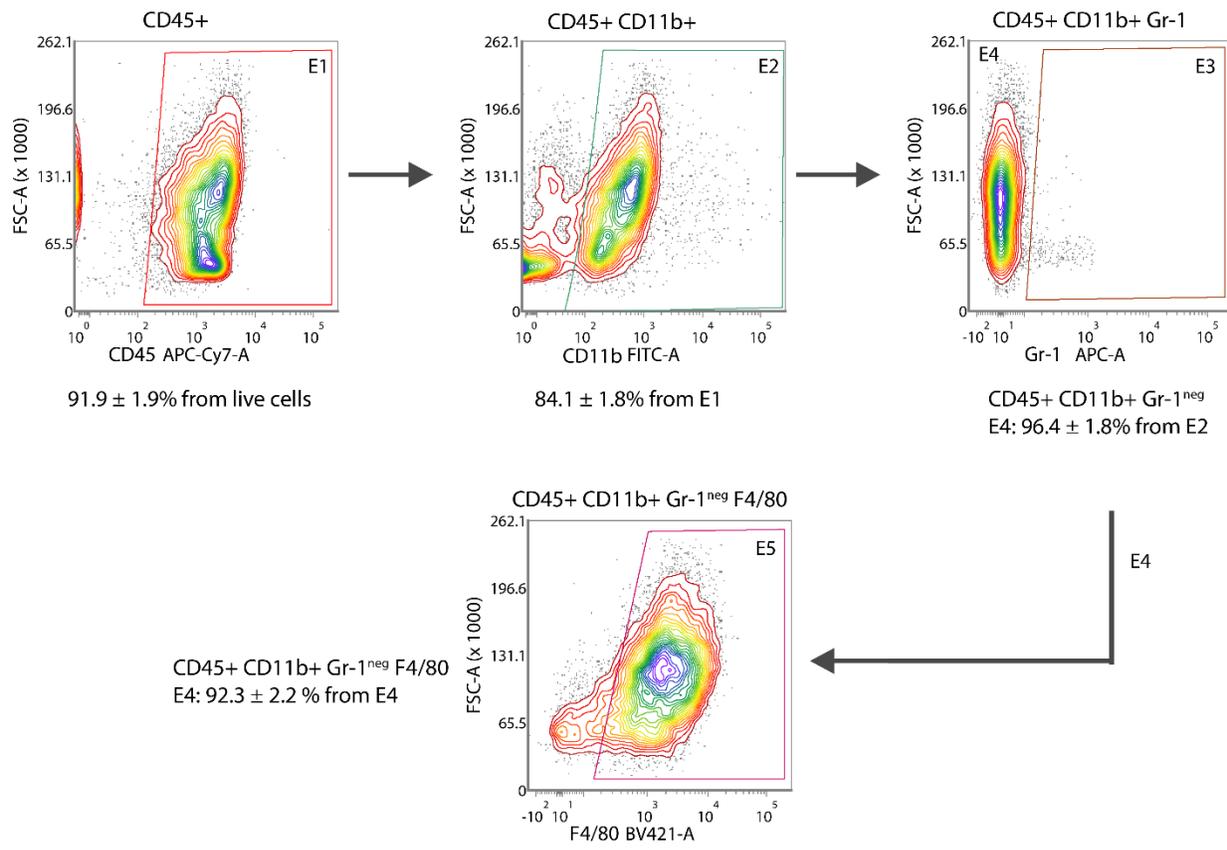

Figure S20. Immunophenotyping of infiltrating cells in E₂ implants at day 3.

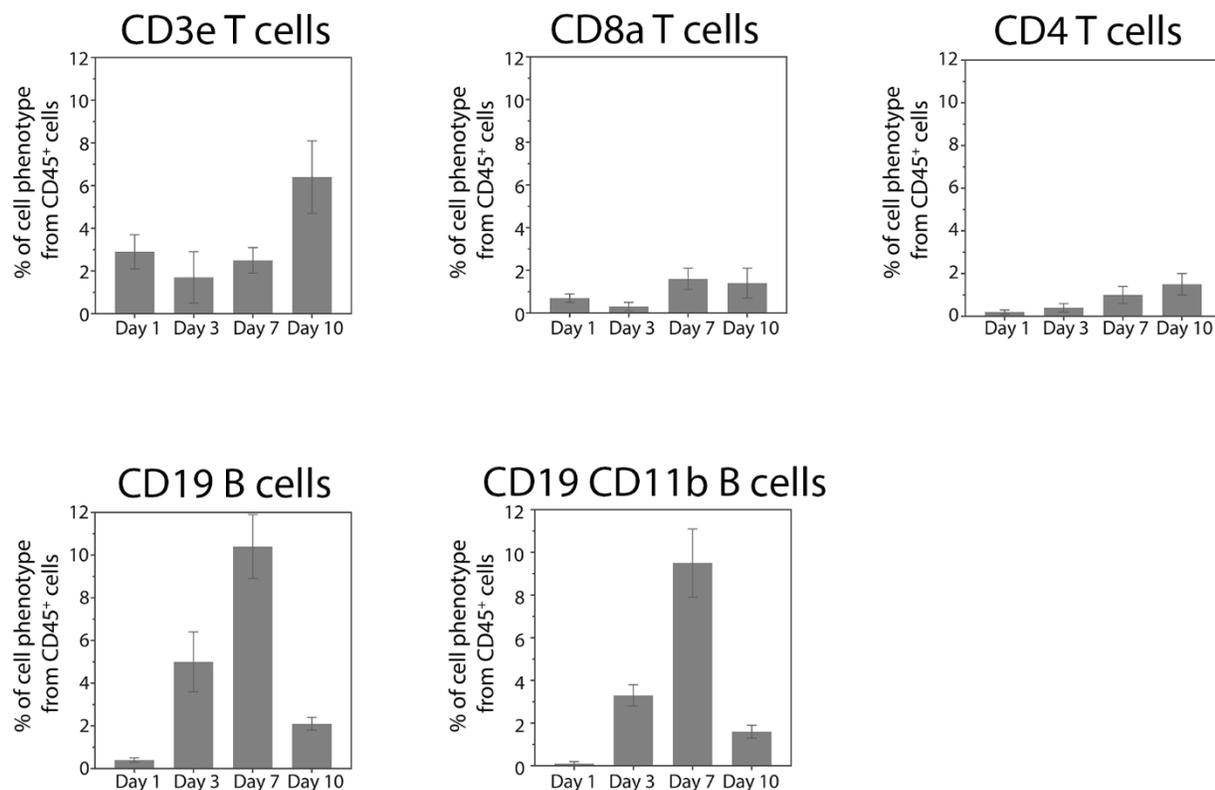

Figure S21. Percentage of different lymphoid cell phenotypes from CD45⁺ cells present in K₂ implants at day 1, 3, 7 and 10 post-injection.

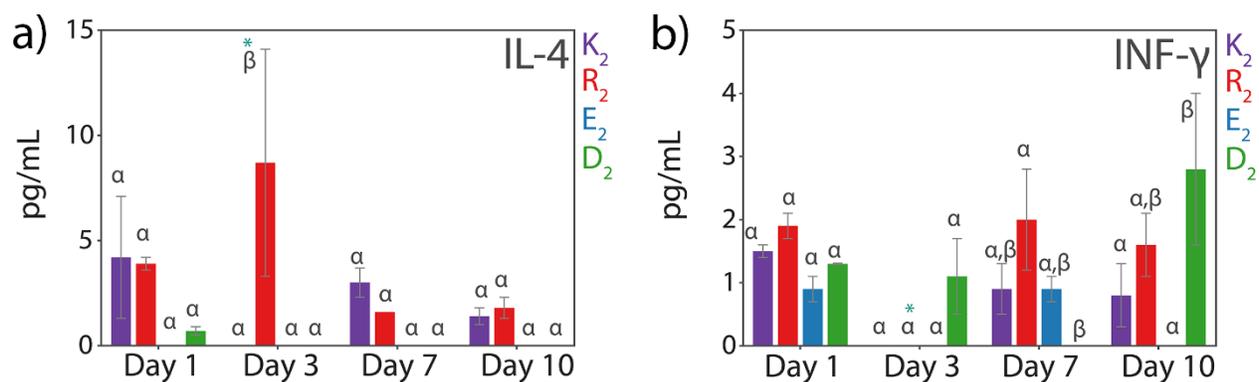

Figure S22. Quantification of IL-4 and INF- γ from the implant lysate.

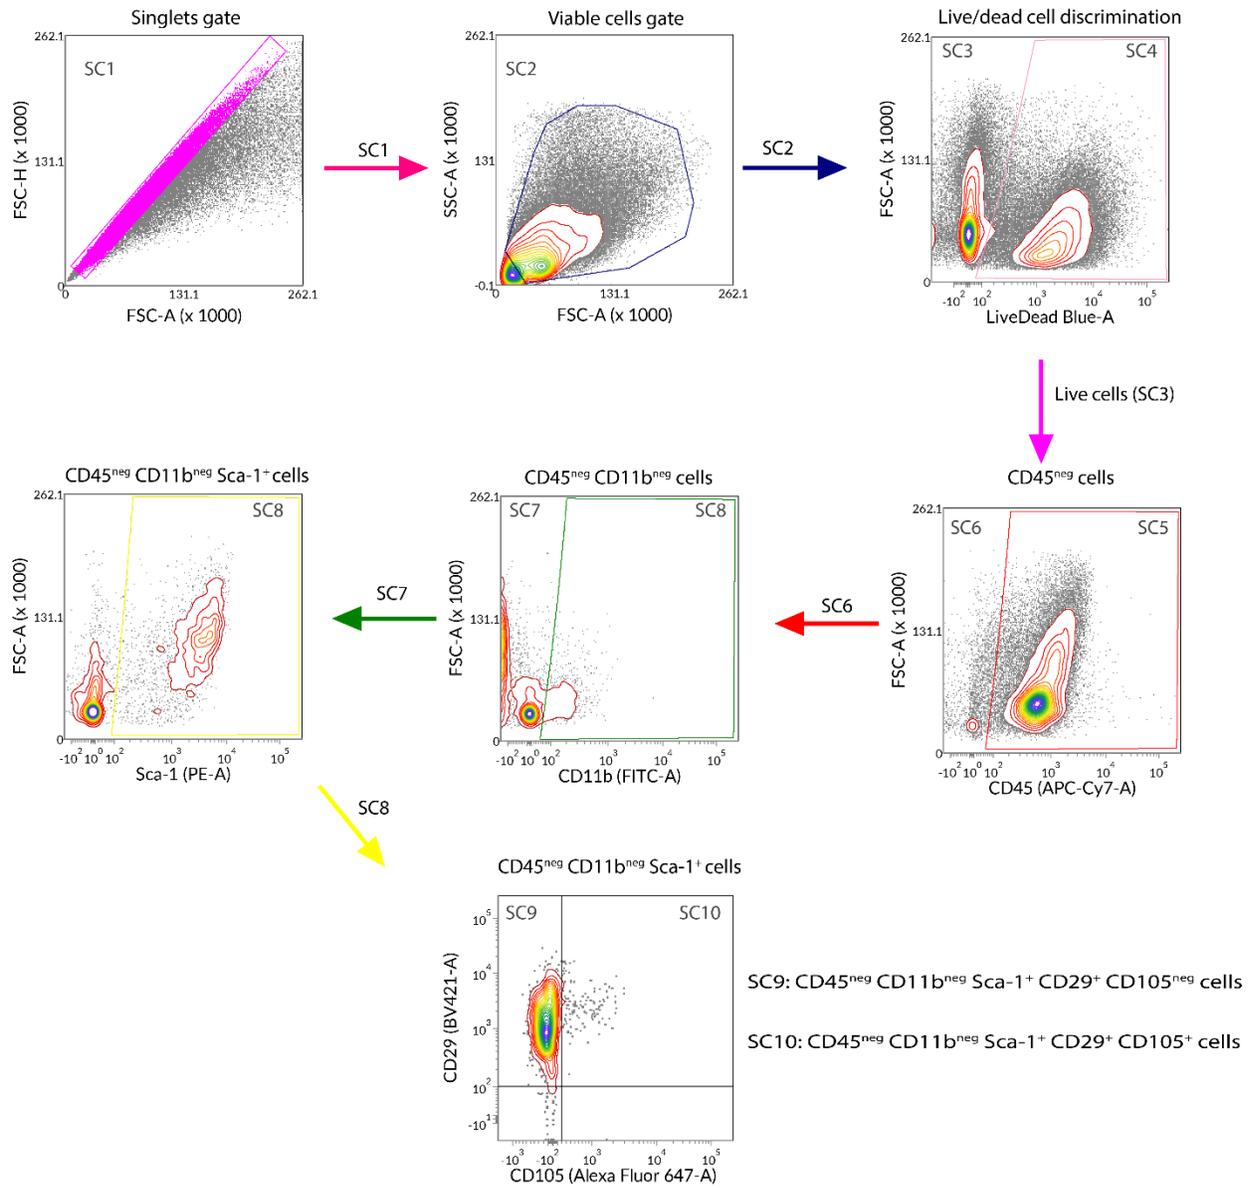

Figure S23. Gating strategy for the immunophenotyping of stem cells in the MDP hydrogels.
