

Supplementary Figure 2 Frequency of antigen-specific CD4⁺ T cells producing each cytokine combination. Six weeks after immunisation with BCG via IN or ID route, intravascular staining & ICS identified populations of lung parenchymal and lung vascular PPD-T-specific (cytokine⁺) CD4⁺ T cells producing IFN- γ , TNF- α or IL-2 alone or in combination. Bars represent mean \pm SEM ($n=6$). Statistical comparison is between naïve and BCG-immunised groups. Two-way ANOVA with Sidak's post-test * $P<0.05$, ** $P<0.01$, *** $P<0.001$ **** $P<0.0001$. Data representative of one of two independent experiments.
