

Supp. Figure S1. Association between parent-child anxiety discrepancy score and qualitative abnormalities in communication measured by the Autism Diagnostic Interview-Revised in the ASD-combined group (ASD with comorbid anxiety plus without comorbid anxiety, $n = 52$). Parent-child discrepancy score = standardized parent MASC-2 Total Anxiety T-score – standardized child MASC-2 Total Anxiety T-score.

Supp. Figure S2. Association between parent-child anxiety discrepancy score and restricted, repetitive, and stereotyped patterns of behavior measured by the Autism Diagnostic Interview-Revised in the ASD-combined group (ASD with comorbid anxiety plus without comorbid anxiety, $n = 52$). Parent-child discrepancy score = standardized parent MASC-2 Total Anxiety T-score – standardized child MASC-2 Total Anxiety T-score.
