

Supplementary Material

Supplementary Figure 1. Inability of T cell clone to express IFN γ at high antigen-stimulation. T cell clones 22 and 41 do not express IFN γ , even when co-cultured with 10 μ g/ml peptide-stimulated BCL. Only T cell clone 29 expresses IFN γ , at both 1 μ g/ml and 10 μ g/ml peptide-stimulated BCL. N, number of experimental repeats= 3. * represents P-value less than 0.5, analysis performed with one-way ANOVA with Tukey's multiple comparison test.

Supplementary Figure 2. Surface phenotype of SSX-2-specific T cell clones. Representative dot plots showing that all six T cell clones have surface expression of CD45RA, CD45RO, CCR7, CD28 and CD227 *in vitro*.

Supplementary Figure 3. CpG methylation of TNF α promoter. In contrast to IFN γ methylation, no presence of CPG methylation was found on each of the tumor-specific CTL clones tested.
