

**Supplementary Figure 1, related to the Experimental Methods.** Representative trace of  $\Delta\Psi$  (depicted as the 572/551 ratio) and NAD(P)H/NAD(P)<sup>+</sup> redox (expressed as RFU, Ex:Em, 350:450). Final values for each measurement were normalized based on the values recorded following a final addition of alamethicin ('Ala').

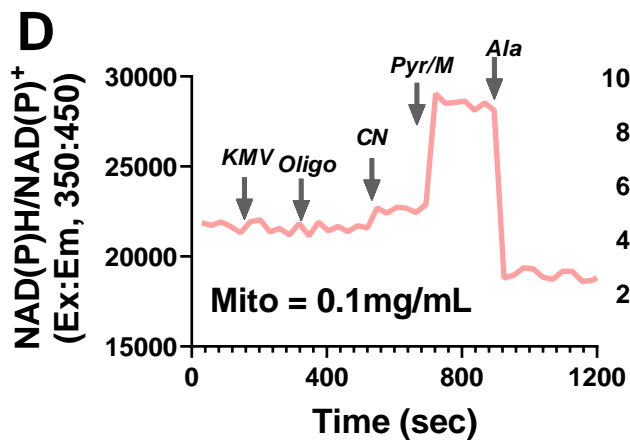

**Supplementary Figure 2, related to Figure 2.** All experiments were performed in isolated heart mitochondria at varying concentrations (0.1, 0.375, 1mg/mL) incubated with the CK clamp established with a starting PCR concentration of 1mM. Bicarbonate was present for all experiments. (A) Representative trace depicting NAD(P)H/NAD(P)<sup>+</sup> redox following the sequential addition of KMV or Pyr/M, Oligo and cyanide (CN). Pyr/M was added to KMV energized mitochondria at the end of the protocol. (B) Quantification of the data depicted in panel A. (D) Representative trace depicting NAD(P)H/NAD(P)<sup>+</sup> redox following the sequential addition of KMV, Oligo, CN, Pyr/M and Ala. The mitochondrial concentration for each experiment was 0.1mg/mL, 0.375mg/mL or 1mg/mL. (E) Quantification of the data depicted in panel C for 1mg/mL mitochondria. Note the increase in redox state from mitochondria alone ('mt') to KMV ('Sub'). (F) Relationship between NAD(P)H/NAD(P)<sup>+</sup> redox and ATP free energy in KMV energized mitochondria (1mg/mL). Data are mean  $\pm$  SEM, n=4/group, \*P<0.05.

**Supplementary Figure 3, related to Figure 3.** All experiments were performed in isolated heart and liver mitochondria incubated with the CK clamp established with a starting PCR concentration of 21mM. Bicarbonate was present for all experiments. Experiments were performed either in the presence of 5mM malonate or vehicle control. (A) Representative trace depicting  $JO_2$  in liver mitochondria in the absence and presence of 5mM malonate in response to KIC (2mM) and succinate (1mM). (B) Quantification of the KIC-dependent  $JO_2$  in the absence and presence of 5mM malonate in heart and liver mitochondria. KIC-dependent respiration was quantified by subtracting the oxygen consumption prior to the addition of KIC from the rates recorded in response to KIC. Data are mean  $\pm$  SEM, n=3-4/group.

**Supplementary Table 1.** Table indicating the concentrations of each substrate combination and inhibitor used for all experiments.

<b>Substrate Conditions</b>	<b>Concentration</b>
Pyruvate/Malate/Glutamate/Succinate/Octanoyl-carnitine (P/M/G/S/O)	Pyr: 5mM, G: 5mM, M: 2mM, S: 5mM, Oct: 0.2mM
Malate (Mal or M)	2mM
Ketoisovalerate (KIV)	2mM
Ketoisocaproate (KIC)	2mM
Ketomethylvalerate (KMV)	2mM
Malonate (Malo)	5mM
Pyruvate (Pyr)	5mM
Glutamate (G)	10mM
Succinate (Succ)	10mM
Octonoyl-Carnitine (Oct)	0.2mM
Rotenone (Rot)	0.005mM
Antimycin A (AntA)	0.005mM
Carbonyl cyanide-p-trifluoromethoxyphenylhydrazone (FCCP)	0.002mM
Cyanide (Cyn)	10mM
Alamethicin (Ala)	0.03mg/mL
Oligomycin (Oligo)	0.005mM
Alpha-Ketoglutarate (AKG)	10mM
NaCl	3mM
BCKAs	KIC, KMV, KIV: 1mM
Isocitrate	5mM
Carnitine (Carn)	5mM
