

Figure S6: Unique patterns of V-J usage for persistent, non-persistent and de novo clonotypes of 11-mer (i) and 12-mer (ii) CDR3b of the GLC-BM-specific CD8 T-cell responses. The frequencies of V-J combinations in three AIM donors for GLC-BM-specific TCRb repertoires are displayed in circos plots, with frequency of each V or J cassette represented by its arc length and that of the V-J cassette combination by the width of the arc.
