

Supplementary Figure 1 Proliferation of MHV-A59 in MEFs. WT MEFs were infected with MHV-A59 (MOI = 1). **(A)** At the indicated time points post-infection, total RNA was extracted and the mRNA level of MHV-A59 N gene was determined by RT-PCR. **(B)** The titer of MHV-A59 in the medium was determined by plaque assay and the result was expressed as Lg PFU/ml. The data represented at least three independent experiments.
