## **Supplementary Figure**

(A) A. vaginae CM does not disrupt endocervical epithelium. Polarized A2EN were treated with either End1+mock CM or A. vaginae CM at 4X concentration for 72 hours, with retreatment and TEER measurement every 24 hours. 4 different preparations of CM were used. (B) MMP10 standard curve. MMP10 was used as a reference for MMP activity measured by the Generic MMP activity fluorometric assay used in Figure 4. n=3 for each point, except 6.25  $\mu$ g/ml, which was measured only once.
