74 **External standard calibration method for PG quantization.**

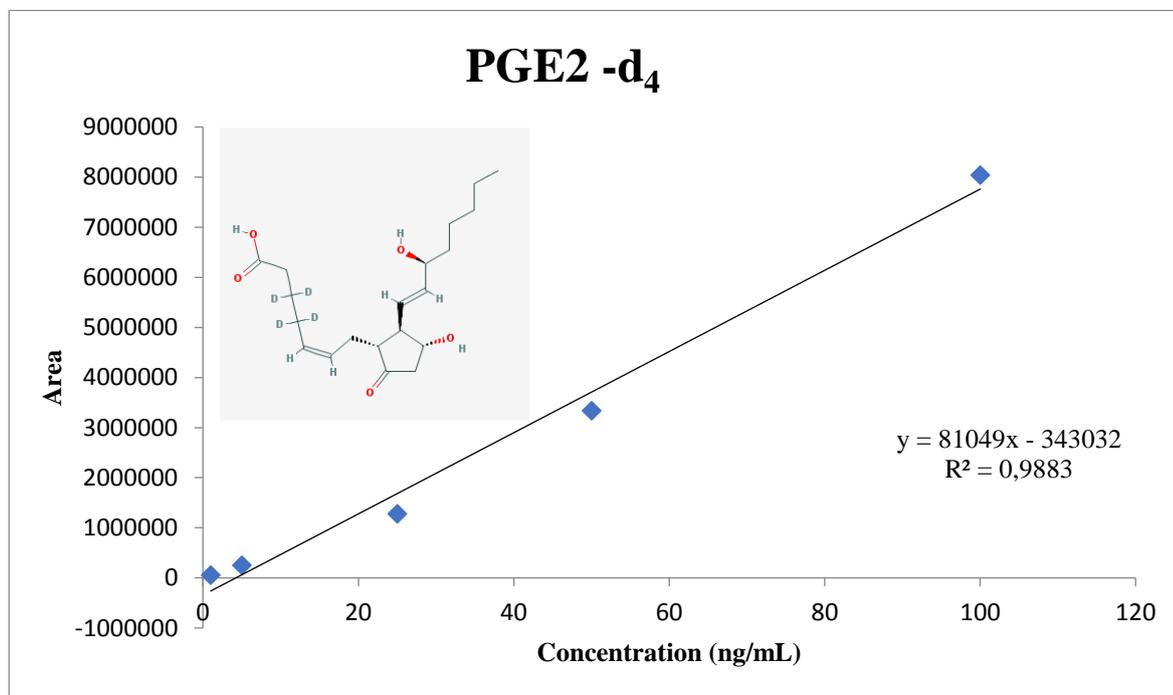

75 For an external standard quantitation, known data from a calibration standard and unknown data from
76 the sample are combined to generate a quantitative report. Working standard solutions containing all
77 the analytes at 1 $\mu\text{g}/\text{mL}$ were prepared, from stock solutions of 100 $\mu\text{g}/\text{mL}$ for each standard: PGE₂,
78 15-d-PGJ₂, PGB₂, PGD₂, PGJ₂ (SIGMA ALDRICH, Saint Louis, MO), 20-oh-PGE₂, 6-keto-PGF₁ α ,
79 DHK (CAYMAN CHEMICAL, Michigan, USA). From these standard solutions, five solutions at
80 different concentration levels were prepared: 1, 5, 25, 50, 100 ng/mL for the construction of the
81 calibration curves. The coefficients of determination (R²) were used to evaluate the linearity of the
82 calibration ranges. All R² were greater than 0.99, demonstrating that the method was linear in the
83 range of calibration for all analytes.

84 The amount of prostaglandins was normalized by the sampled volume extracted for each daily
85 replicate and then by the number of cells per mL for each replicate. The final value reported in the
86 graph were pg cell⁻¹.
