

Supplemental figure 1.

C-terminal deletion mutant completely lost its activity of translational shutoff. Luciferase activities in 293T cells transfected with either pcD-fluc or pcD-5'-fluc together with the nsp1 deletion mutant, pCAG-nsp1-1-188 were determined at 24 h posttransfection after standardization with those in cells expressing CAT. The values represent the means \pm SD from three independent experiments.
