XRD patterns were collected by a D8 Bruker Diffractometer. The UV-Vis absorption spectra were collected using a Shimadzu UV-Vis 2550 spectrophotometer fitted with an integrating sphere using BaSO<sub>4</sub> as the reference material. XPS measurements were done on a ThermoScientific XPS K-alpha surface analysis machine using an Al source. Analysis was performed on the Casa XPS software. SEM images were taken by a JEOL JSM-7401F Scanning Electron Microscope. BET measurements were performed by a Tri Star II. NMR spectra were performed with a solid state NMR spectrometer, Ascend™, 300WB, Bruker. PL spectra were collected by a Renishaw InVia Raman Microscope (325nm).

$^1\text{H}$  Solid state NMR spectrum of ref- $\text{g-C}_3\text{N}_4$  contains two main peaks at 8.9 ppm and 4.2 ppm, which can be attributed to the chemical shifts of  $-\text{NH}_x$  ending group and residual water, respectively.<sup>1</sup> An additional clear peak locating at 4.5 ppm is present in def- $\text{g-C}_3\text{N}_4$ -5 sample and can be ascribed to the formation C-OH bonds.<sup>1</sup>  $^{13}\text{C}$  solid state NMR spectra of these two samples show two similar peaks at 156.8 ppm and 164.7 ppm, which has been assigned to C-[N]<sub>3</sub> and CN<sub>2</sub>(NH<sub>2</sub>) groups, respectively<sup>2</sup>
