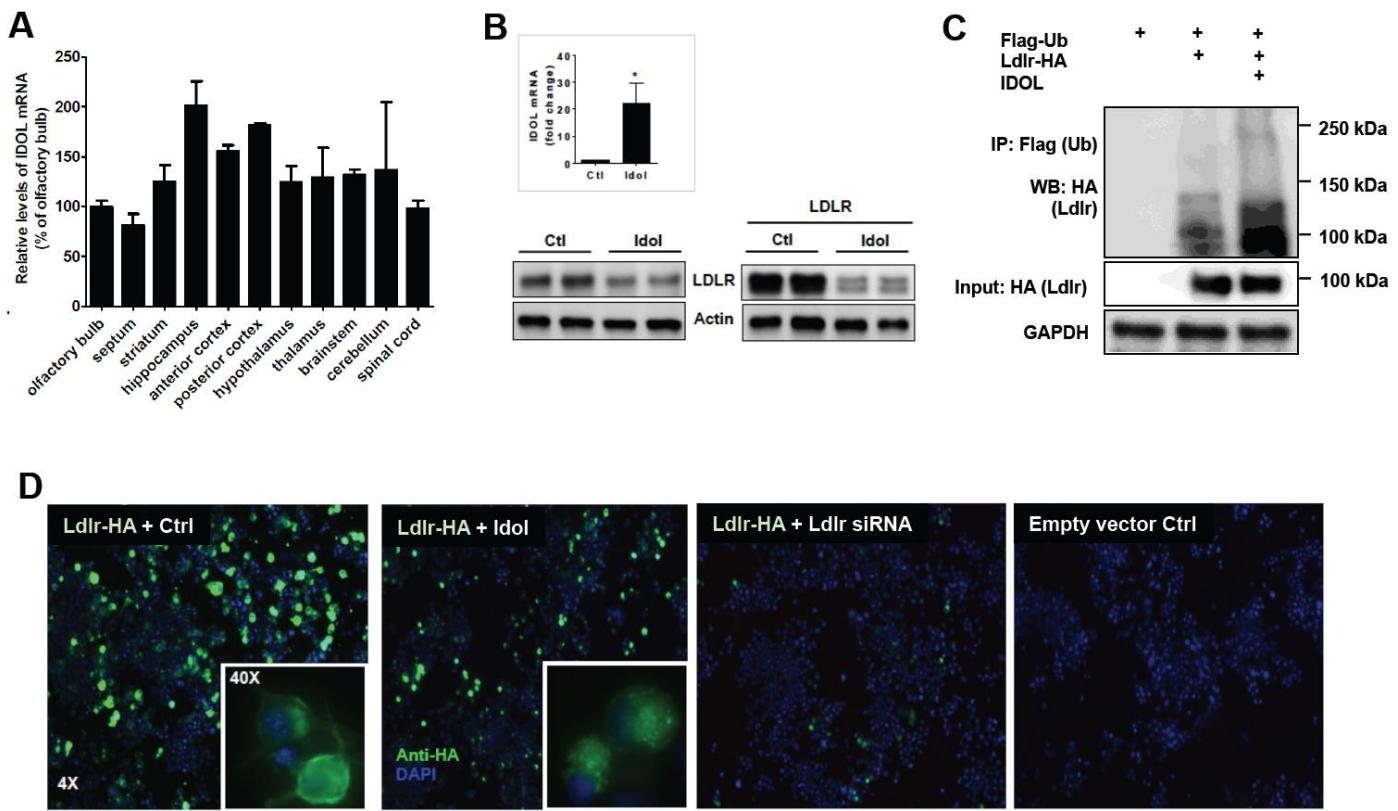

Fig. S1. Idol decreases LDLR protein and promotes LDLR ubiquitination in mouse brain cells.

(A) Real-time PCR analysis of Idol expression in different compartments of the central nervous system, isolated from 3.5 month-old C57BL6J mice. Data are normalized to olfactory bulb. Error bars represent SEM. N = 3. (B) Real-time PCR analysis of Idol expression levels and immunoblot analysis of LDLR protein levels after Idol knockdown. Idol expression plasmid (Idol) or control plasmid (Ctl) was transfected to Neuro2a cells with or without LDLR expression plasmid (LDLR). Error bars represent SEM. *, p < 0.05 by Student's t-test. (C) Immunoblot analysis of LDLR protein level and ubiquitination in the presence of Idol. Flag-tagged ubiquitin (Ub) and HA-tagged LDLR were expressed in Neuro2a cells with or without Idol co-expression. 24 h post-transfection, cell were incubated with 400 nM bafilomycin A1 for 24 h. Cell lysates were immunoprecipitated with Flag antibody and immunoblotted with HA antibody. (D) Representative micrographs showing immunofluorescence staining of Neuro2a cells co-transfected with LDLR-HA expression plasmid and either control or Idol expression plasmid. Green color indicates LDLR-HA stained by anti-HA antibody.

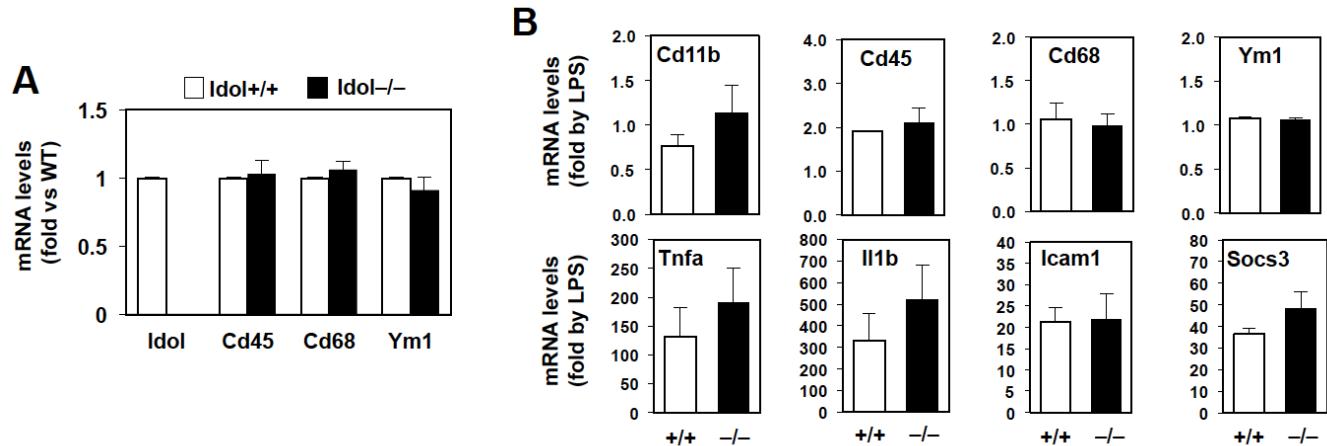

Fig. S2. Loss of Idol does not directly affect inflammatory responses. (A) Real-time PCR analysis of Idol and microglial marker gene expression in primary microglia isolated from *Idol*^{+/+} or *Idol*^{-/-} mice. Cells were cultured in DMEM containing 10% FBS prior to harvest. Data are normalized to wild-type control. Error bars represent SEM. (B) Real-time PCR analysis of neuroinflammatory gene expression in response to LPS in primary microglia isolated from *Idol*^{+/+} or *Idol*^{-/-} mice. Cells were treated with serum-free DMEM containing 100 ng/ml LPS for 4 h prior to harvest. mRNA levels are presented as fold induction by LPS vs. vehicle control. Error bars represent SEM.

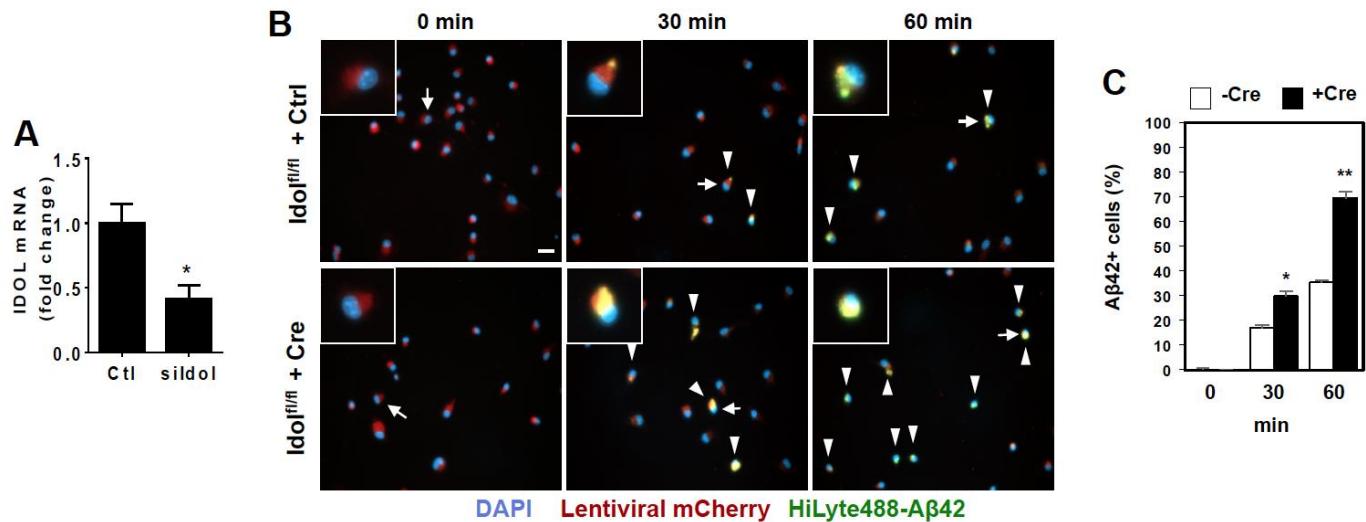

Fig. S3. Idol inhibition promotes the clearance of A β by microglia. (A) Real-time PCR analysis of Idol in Neuro2a cells transfected with Idol siRNA (siIdol) or scrambled negative control (Ctl), related to Figure 6. Data are from RNA harvested at 48 h post-transfection and are normalized to negative control. Error bars represent SEM. *, p < 0.05 by Student's t-test. (B) Representative micrographs showing uptake of HiLyte488 fluorescently labeled aggregated A β ₄₂ in primary microglia from *Idol*^{flox/flox} mice treated *in vitro* with control mCherry-expressing or Cre/mCherry-expressing lentiviral vector. DAPI (blue); Lentiviral mCherry (red); A β ₄₂ (green). Arrowheads denote A β ₄₂-positive cells. Arrows denote representative cells shown in the magnified field. Scale bar, 20 μ m. (C) Quantification of results shown in (B). Error bars represent SEM. *, p < 0.05; **, p < 0.01 by Student's t-test.
