Histidine-Triad Hydrolases Provide Resistance to Peptide-Nucleotide Antibiotics

Eldar Yagmurov¹, Darya Tsibulskaya^{1,2}, Alexey Livenskiy^{2,3}, Marina Serebryakova^{2,4}, Yury I. Wolf⁵, Sergei Borukhov⁶, Konstantin Severinov^{1,7,8*}, and Svetlana Dubiley^{1,2*}

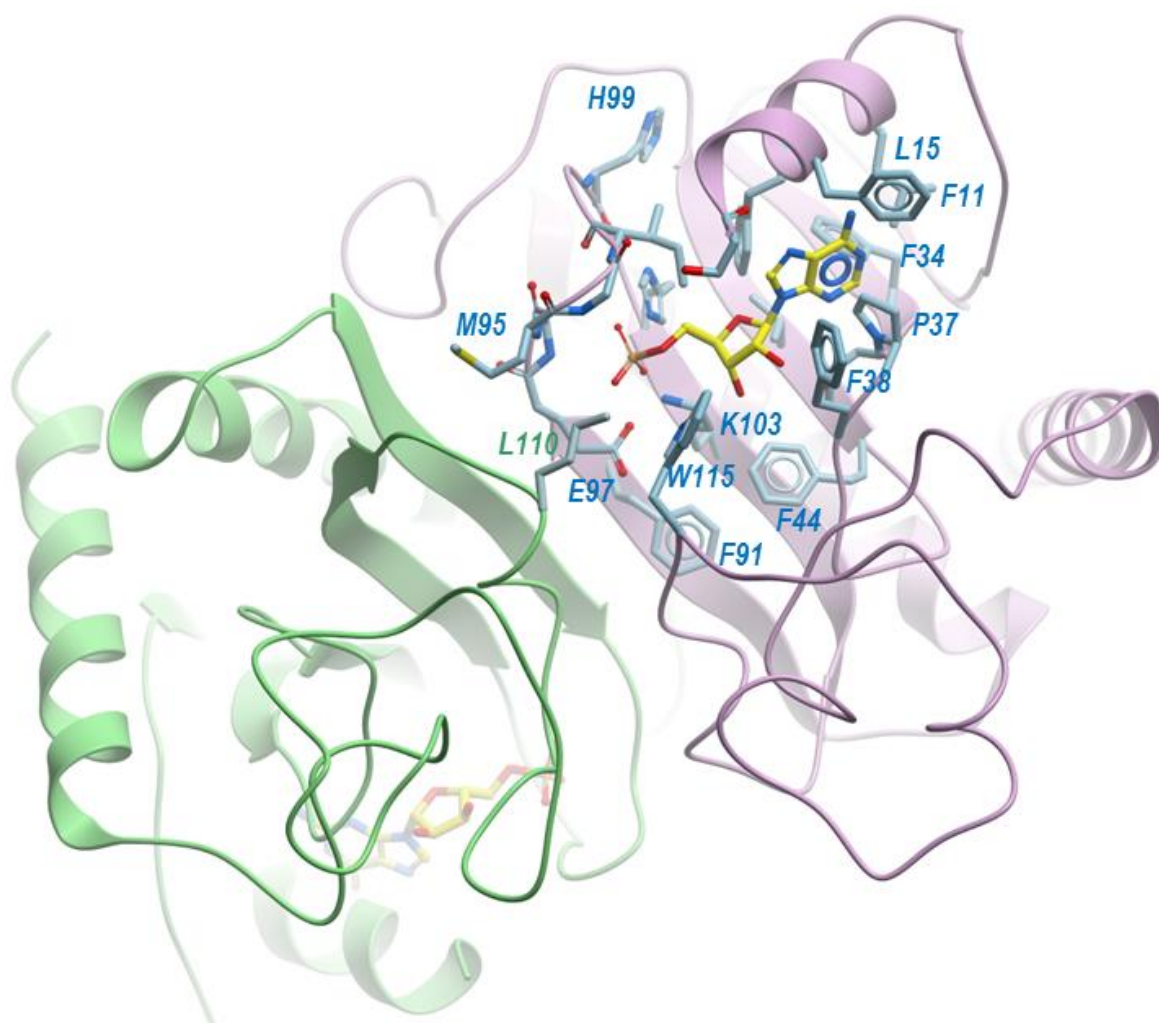

Figure S5. 3D-structural model of McchHmi dimer in complex with AMP. The two monomers of McchH are depicted as light green and purple colored ribbons diagrams. Residues of the active site that form the substrate-binding pocket are labeled and shown in a stick representation.
