

THE LANCET

Supplementary webappendix

This webappendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Acuin CS, Khor GL, Liabsuetrakul T, et al. Maternal, neonatal, and child health in southeast Asia: towards greater regional collaboration. *Lancet* 2011; published online January 25. DOI:10.1016/S0140-6736(10)62049-1.

Table 1: Data sources

Data Source	Country Coverage	Indicators	Estimation methods	Limitations
DHS	Cambodia, Indonesia, Philippines, Vietnam	Time trends for neonatal, infant, under-five mortality, maternal mortality; intervention coverage (vaccination, IMCI, skilled birth attendance, delivery care)	Direct sisterhood method for maternal mortality estimates; direct method for estimation of child mortality rates; estimates of intervention coverage are weighted proportions	Only 4/10 countries covered, time periods per country variable; direct sisterhood method may underestimate maternal deaths; birth transference may underestimate infant mortality
MICS	Laos, Myanmar, Thailand, Vietnam	Estimation of infant, under-five mortality rates; intervention coverage (vaccination, IMCI, skilled birth attendance, delivery care)	Indirect estimation of infant and under-five mortality rates; estimates of intervention coverage are weighted proportions	Earlier rounds of MICS subject to Only 3/10 countries covered
Inter-agency Group for Child Mortality Estimation (UNICEF and WHO)	All 10 countries	Standardized estimation of time trends in infant, under-five mortality rates, 1990-2009 for 196 countries	Linear spline regression for countries without high HIV/AIDS prevalence, Loess regression for countries with high HIV/AIDS prevalence; weights applied for country data sources	Do not address potential mortality shocks other than HIV/AIDS epidemic; Loess forecasts of mortality decline may be conservative; vital registration available for 5/10 Southeast Asia countries
Institute for Health Metrics and Evaluation; Rajaratnam et al.	All 10 countries	Standardized estimation of time trends in neonatal, infant, under-five mortality rates for 187 countries from 1970-2009	Gaussian process regression of under-five mortality accounting for non-sampling error; infant and neonatal mortality modeled from under-five mortality using multilevel regression	Yields lower estimates of mortality than other methods; similar modeling approach for countries with and without high HIV prevalence; vital registration available for 5/10 Southeast Asian countries
Maternal Mortality Estimation Inter-Agency Group (WHO)	All 10 countries	Standardized estimation of time trends in maternal mortality ratio 1990-2008 for 172 countries	Direct estimation from civil registration sources; multilevel regression model for other types of data sources	Underreporting/misclassification of maternal deaths in household survey sources; did not include subnational data sources
Institute for Health Metrics and Evaluation; Hogan et al.	All 10 countries	Standardised estimation of time trends in maternal mortality ratio for 181 countries, 1980-2008	Two-step spatio-temporal regression	Underreporting/misclassification of maternal deaths in household survey sources; did not extract incidental pregnancy-related deaths; impact of HIV epidemic

				modeled directly; vital registration available for 5/10 Southeast Asian countries; Myanmar and Vietnam no national data available
CHERG:	All 10 countries	Cause of death estimation for neonatal, infant, under-fives	Direct estimation with ICD-10 codes for complete vital registration data; for countries without complete vital registration, separate multicause multinomial regression models for countries with low and high child mortality using verbal autopsy sources; separation estimation of neonatal tetanus, malaria, measles, pertussis, HIV/AIDS	Highest mortality countries of Southeast Asia do not have vital registration, estimates are modeled
