Supplementary Figure S1

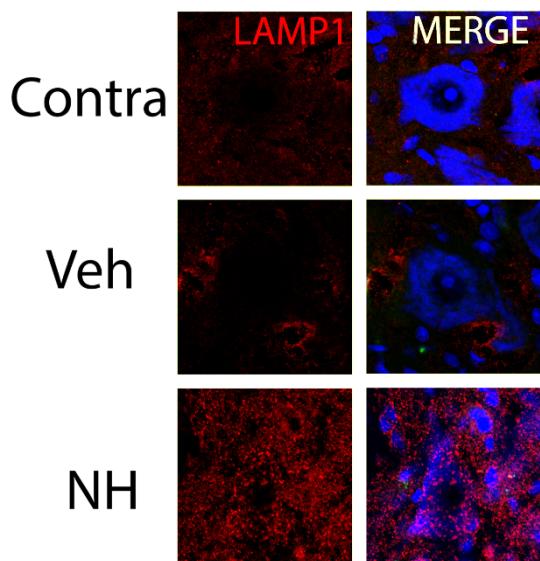

Supplementary Figure S1. *Top*, Representative confocal microphotographs of the immunolabelling of PARP1/2 (red), and FluoroNissl (green), and DAPI (blue) in merged pictures of MNs from different experimental conditions at 10 dpi. Scale bar 20 μm . *Bottom*, Quantification of the integrated density of PARP1/2 in nuclei of MNs (n=4 per group, ANOVA, post hoc Bonferroni, *p<0.05).

Supplementary Figure S2

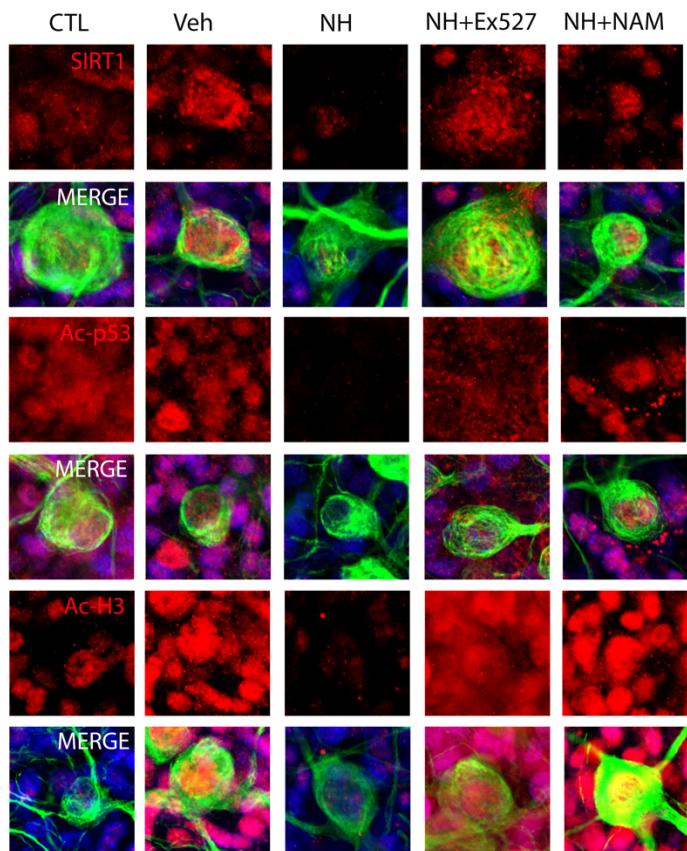

Supplementary Figure S2. **(A)** Representative images from two independent experiments of immunoblots to detect FOXO3a (top) or BIM (down) from NSC34 cells either untransfected (CTL) or nucleofected with either GFP, double negative (DN) or nonphosphorylatable triple mutant (TM) plasmids. Note that FOXO3a corresponding band is normally detected above 80 Kda (band a) except when expression of the deleted form of DN mutant (<50KDa, band b). **(B)** Graph showing the percentage survival (\pm SEM) of transfected NSC-34 cells with respect to cells transfected with control vector analysed at 4 DIV.

Supplementary Figure S3

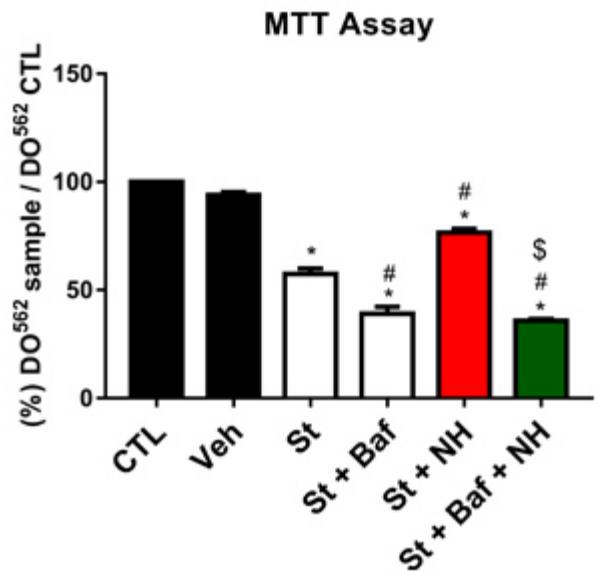

Supplementary Figure S3. Confocal microphotographs of samples stained for LAMP1 (red), and counterstained with FluoroNissl (blue) from a representative contralateral side and injured side of vehicle-treated and NH-treated injured animals at 10 dpi. Scale bar 25 μ m.

Supplementary Figure S4

Supplementary Figure S4. Confocal microphotographs of SOCs immunolabelled for SIRT1, p53Ac, or H3K9Ac (red), SMI3-32 (green), and DAPI (blue) at 15 DIV after the treatment with vehicle, NeuroHeal (NH), or NH+SIRT1 inhibitors. Scale bar 25 μ m.

Supplementary Figure S5

Supplementary Figure S5. Analysis of cell survival using MTT assay in different conditions: 100 μM Bafilomycin A1 (a V-ATPase inhibitor, Baf) to apoptotic cells induced by staurosporine (St) and treated with NeuroHeal (NH). Ctrl, control; veh1, 0.0002% DMSO; veh2, 0.01 % etOH. * $p<0.05$ vs Control; # $p<0.05$ vs St; \$ $p<0.05$ vs St+NH.
