

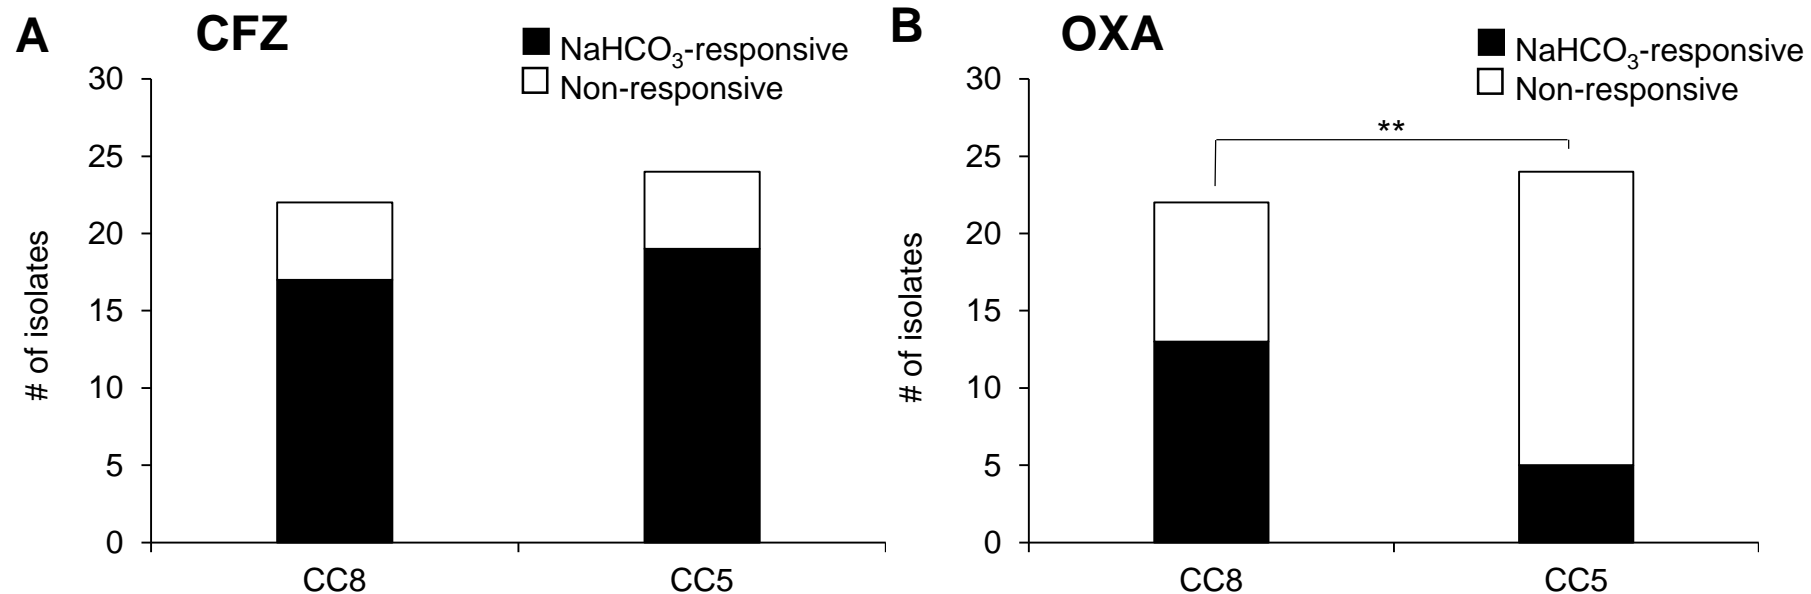

**Figure S1**

**FIG S1.** Relationship between CC types and responsiveness to CFZ and OXA. **(A)** Frequency of NaHCO<sub>3</sub>-responsiveness to CFZ within the two most common CC types in cohort (CC8 and CC5). Neither CC8 nor CC5 was a better predictor of responsiveness to CFZ (Chi-squared analysis,  $P = 0.2$ ). **(B)** Frequency of NaHCO<sub>3</sub>-responsiveness to OXA within CC8 and CC5. CC8 was a better predictor of responsiveness to OXA than CC5 (Chi-squared analysis,  $**P = 0.008$ ).
